## **DESTRUCTION NOTICE**

**WHY**—To prevent the enemy from using or salvaging this equipment for his benefit.

**WHEN**—When ordered by your commander, or when you are in immediate danger of capture.

**HOW**—1. **Smash**—Use sledges, axes, hand-axes, pick-axes, hammers, crowbars, heavy tools, etc.

2. **Cut**—Use axes, hand-axes, machete, etc.

3. **Burn**—Use gasoline, kerosene, oil, flame-throwers, incendiary grenades, etc.

4. **Explosives**—Use firearms, grenades, TNT, etc.

5. **Disposal**—Bury in slit trenches, fox-holes, other holes. Throw in streams. Scatter.

6. **USE ANYTHING IMMEDIATELY AVAILABLE FOR DESTRUCTION OF THIS EQUIPMENT.**

**WHAT**—1. **Smash**—Meter, crystal, controls, tubes, switches, plugs, sockets, dials, capacitors, transformers, and dynamotor.

2. **Cut**—Cables, wiring, and cords.

3. **Bend and/or break**—Panel, chassis, and cabinet.

4. **Burn**—Diagrams, charts, cables, cords, capacitors, transformer, and dynamotor.

5. **Bury or scatter**—Any or all of the above pieces after breaking or burning.

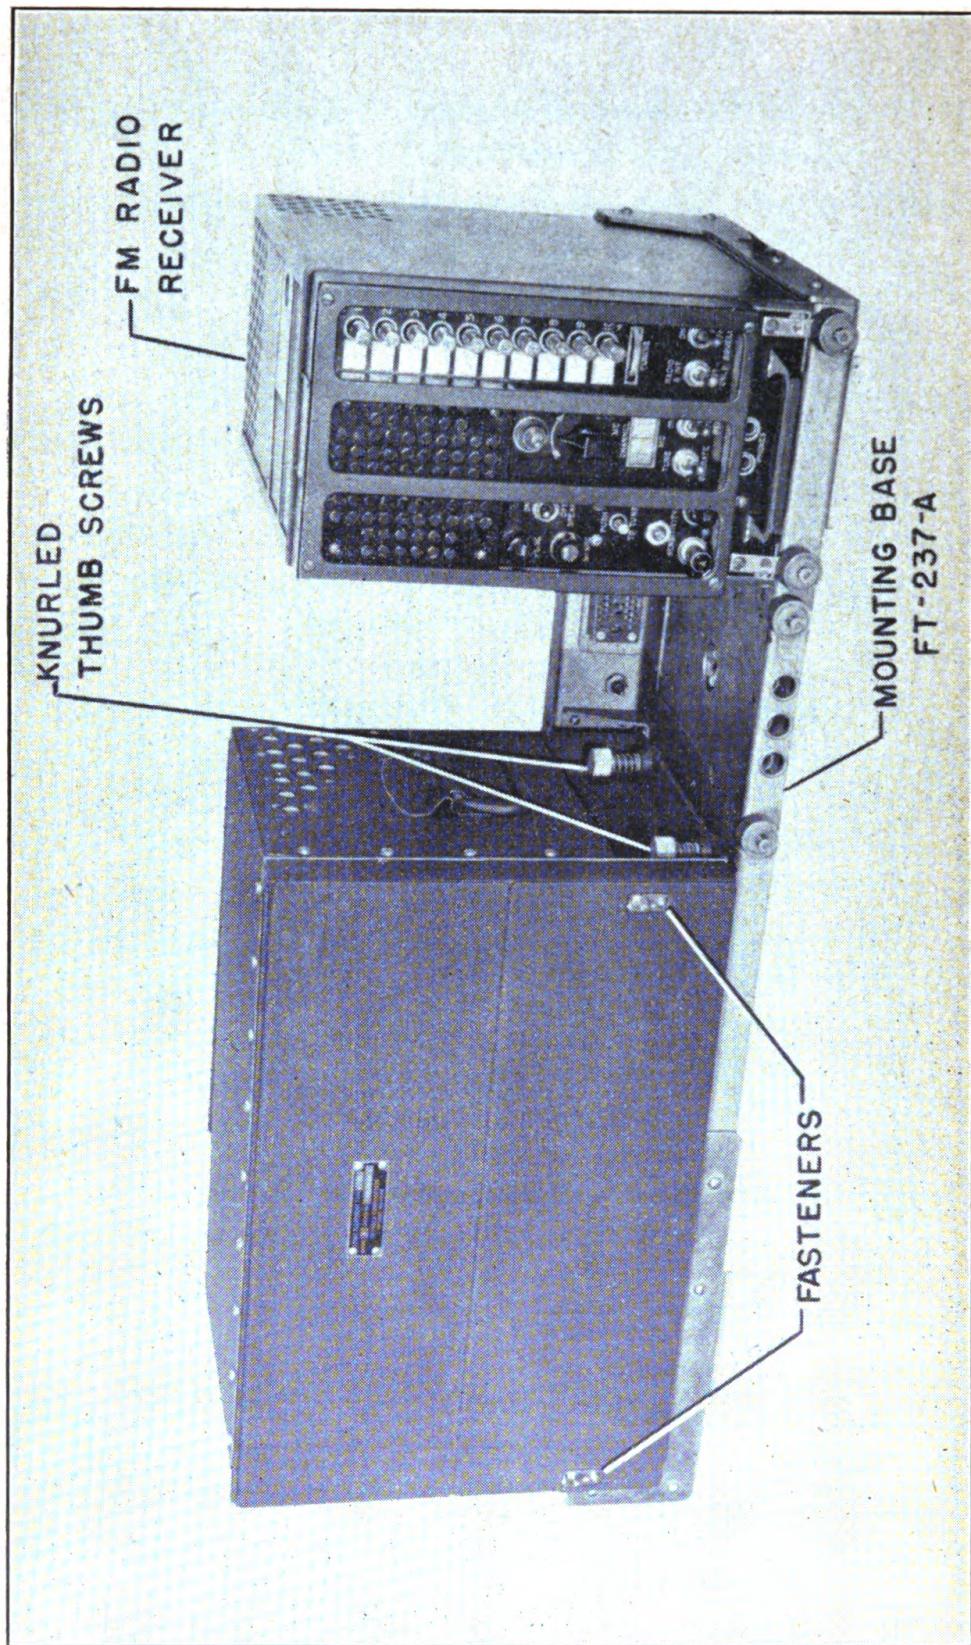

## **DESTROY EVERYTHING**

## **SAFETY NOTICE**

**THIS EQUIPMENT USES DANGEROUSLY HIGH VOLTAGES. DO NOT CHANGE VACUUM TUBES OR MAKE ADJUSTMENTS WITHIN ANY UNIT OF THE EQUIPMENT WITH THE DYNAMOTOR RUNNING OR WITH THE A-C POWER SUPPLY IN OPERATION, EXCEPT AS SPECIFICALLY DIRECTED IN THIS MANUAL.**

**TM 11-317**

**SIGNAL CORPS**

**Figure 1—Signal Generator I-208 on Mounting FT-237-A**

## SECTION I DESCRIPTION

	<i>Paragraph</i>
General	1
Characteristics	2
Source of power	3
Main components	4

### 1. General

Signal Generator I-208 is a frequency and voltage standard for testing frequency modulation radio equipment. It is used in the calibration, alignment, and determination of sensitivity of frequency modulation radio receivers. The signal generator may be installed on Mounting FT-237-(\*) for use in mobile units or for field use (figure 1).

### 2. Characteristics

a. **Range:** The signal generator covers two frequency ranges. These are 1.9 to 4.5 megacycles and 19 to 45 megacycles.

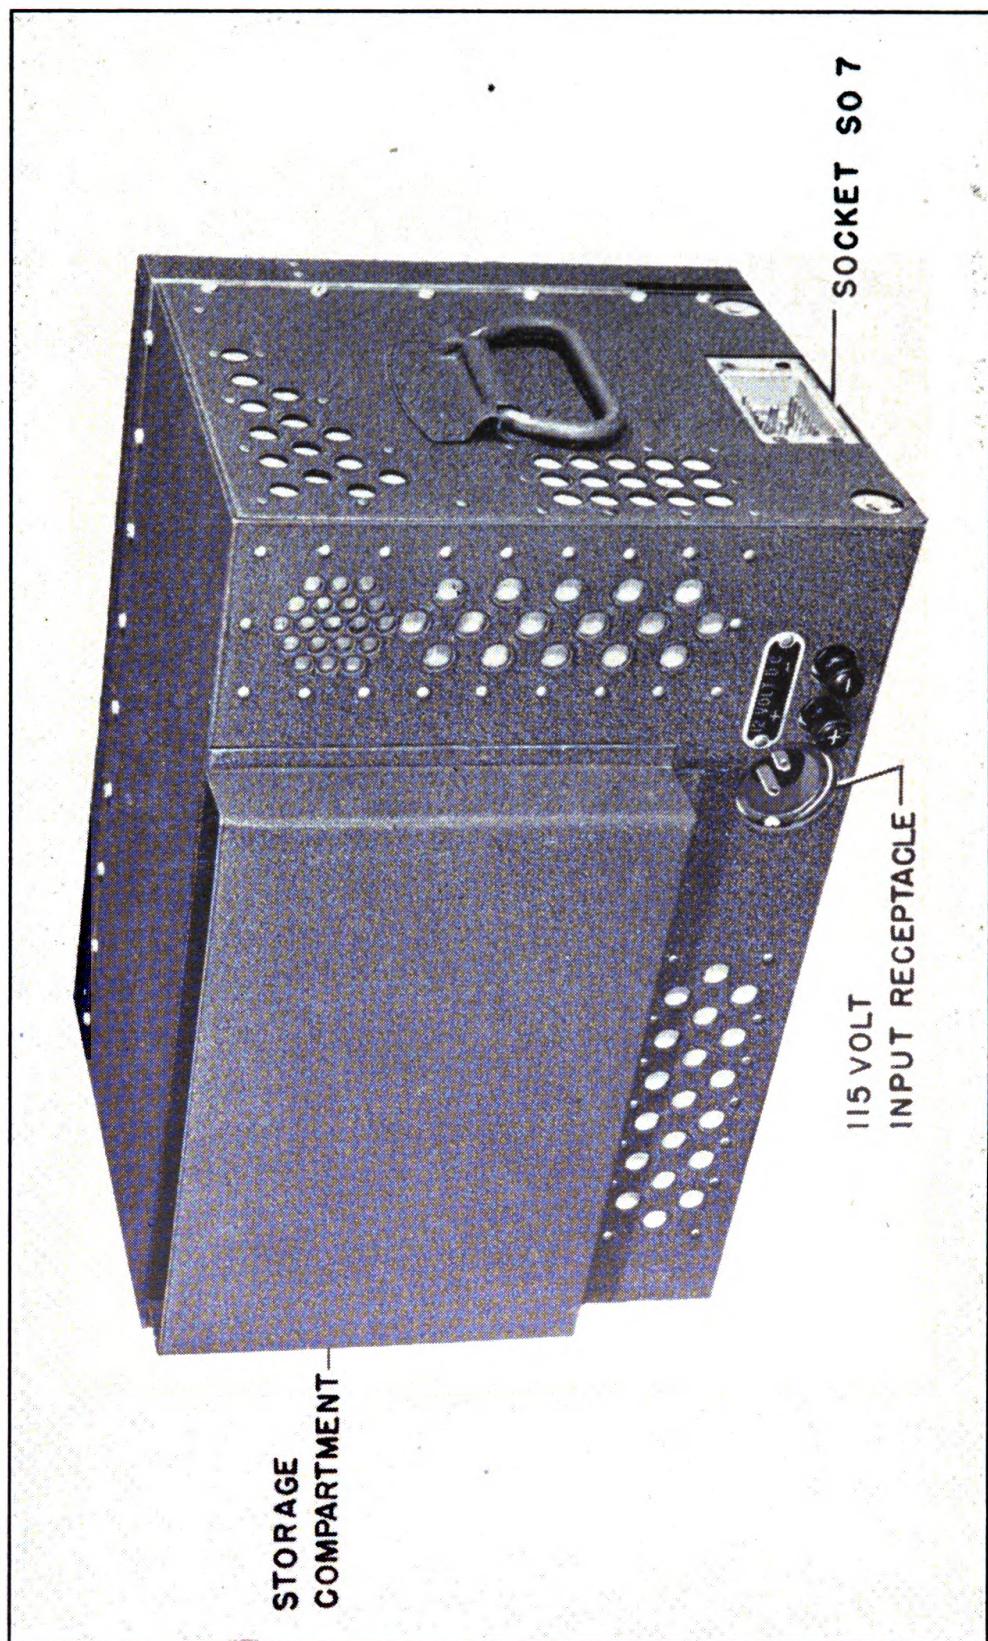

b. **Frequency deviation:** The frequency deviation can be adjusted from 0 to 5 kilocycles each side of center frequency for the 1.9 to 4.5 megacycle band, and from 0 to 50 kilocycles each side of center frequency for the 19 to 45 megacycle band. Frequency deviation is controlled by a calibrated control marked K. C. DEVIATION.

c. **Modulation:** Five modulation frequencies are provided by an internal audio oscillator. They are 150, 400, 1000, 2500, and 5000 cycles per second. Terminals on the front panel provide for external modulation.

d. **Output:** Output voltage up to 100,000 microvolts is developed at the termination of a 30-ohm line. This output is controlled and measured by a calibrated attenuator, multiplier, and vacuum tube voltmeter. Output signal voltage, up to .84 volt, is delivered through the high output terminal and the high output cable which is stored in a compartment at the rear of the signal generator (figure 2). This output is controlled by a potentiometer and measured by the vacuum tube voltmeter.

**TM 11-317**

**SIGNAL CORPS**

**Figure 2—Signal Generator I-208, rear view**

**e. Output signal:** The frequency of the output signal is maintained within .03 per cent of the dial indication over a temperature range from 0° to 60° C through the use of a crystal calibrator unit included in the signal generator.

### 3. Source of Power

- a. 12-volt direct current (11 to 14 volts).
- b. 115-volt 60-cycle, alternating current (105 to 130 volts).

### 4. List of Components

Signal Generator I-208      105 lbs      19" x 12 $\frac{1}{8}$ " x 11 $\frac{1}{2}$ "  
with the following installed:

- a. Cord CD-778, 115-volt power cord ..... 8 oz      8 feet long
- b. Cord CD-749, high output cable ..... 4 oz      40 inches long
- c. Cord CD-984, service extension cord ..... 6 oz      36 inches long
- d. Crystal Unit DC-23-A  
(1 in use, 1 spare) .....  $\frac{1}{2}$  oz ea.      1 $\frac{1}{8}$ " x 1 $\frac{1}{8}$ " x  $\frac{7}{16}$ "
- e. Dynamotor DM-64-A ..... 5 $\frac{1}{2}$  lbs      6 $\frac{9}{16}$ " x 4 $\frac{1}{4}$ " x 3 $\frac{3}{8}$ "
- f. Fuse FU-53  
(1 in use, 9 spare) .....  $\frac{1}{4}$  oz ea.      1 $\frac{1}{4}$ " x  $\frac{1}{4}$ " dia.
- g. Fuse FU-54  
(1 in use, 9 spare) .....  $\frac{1}{4}$  oz ea.      1 $\frac{1}{4}$ " x  $\frac{1}{4}$ " dia.
- h. Lamp LM-27 (3 in use, 6 spare) .....  $\frac{1}{4}$  oz ea.      1 $\frac{1}{8}$ " x  $\frac{7}{16}$ " dia.
- i. Spare dial film ..... 2 oz      1 $\frac{3}{8}$ " x 1 $\frac{7}{8}$ " dia.
- j. 3 sets of tubes  
(1 set in use, 2 spare) ..... 1 lb 14 oz Two sets in carton  
ea. set      5 $\frac{3}{4}$ " x 9" x 12 $\frac{3}{4}$ "
- k. Technical Manual  
TM 11-317 (2 supplied) ..... 3 $\frac{1}{2}$  oz ea.      5 $\frac{1}{2}$ " x 8 $\frac{1}{2}$ "

## **SECTION II**

### **INSTALLATION AND OPERATION**

	<i>Paragraph</i>
<b>Installation</b>	5
<b>Operation</b>	6

#### **5. Installation**

a. When the signal generator is installed on Mounting FT-237-(\*), make the 12-volt, d-c input connections to the power receptacle by sliding the signal generator to the left as far as it will go and tightening the knurled thumb screws at the lower right of the signal generator (figure 1). Some Mountings FT-237-(\*) have plug covers installed on the left side of the rear rail. These covers must be removed before placing the signal generator on the mounting base.

b. For other d-c installations, two binding posts are provided on the rear of the signal generator for the 12-volt, d-c input leads.

**CAUTION: MAKE SURE THE POSITIVE POST OF THE POWER SOURCE IS CONNECTED TO THE POSITIVE BINDING POST MARKED (+) AND THAT THE NEGATIVE POST IS CONNECTED TO THE BINDING POST MARKED (-).**

c. For operation from a 115-volt, 60-cycle source, one end of Cord CD-778 is plugged into the receptacle at the rear of the signal generator and the other end connected to any 115-volt, 60 cycle, a-c source.

**NOTE: NEVER TRY TO OPERATE THE SIGNAL GENERATOR FROM A SOURCE OTHER THAN 115-VOLT, 50 TO 70-CYCLE, A-C.**

#### **6. Operation**

##### **a. Initial procedure**

(1) See that the POWER switch is at OFF. Throw power selector switch to correspond with available power source (12 DC or 115 AC).

(2) Check the meter reading. The pointer must be at 0. If it does not read 0, very carefully adjust the meter adjusting screw (figure 4) so that the meter needle is at zero.

(3) After you have installed the signal generator as outlined in paragraph 5a, b, or c, and made the adjustments outlined in paragraphs 6a(1) and 6a(2), throw the POWER, PLATE VOLTAGE, and CALIBRATOR switches to ON and allow the signal generator to warm up for about 15 minutes.

(4) While waiting for the signal generator to warm up, determine from the radio receiver alignment procedure the type of coupling (phantom antenna) required between the signal generator and the radio receiver. A network as shown in figure 3 may be used if a specific phantom antenna is not recommended in the receiver alignment procedure.

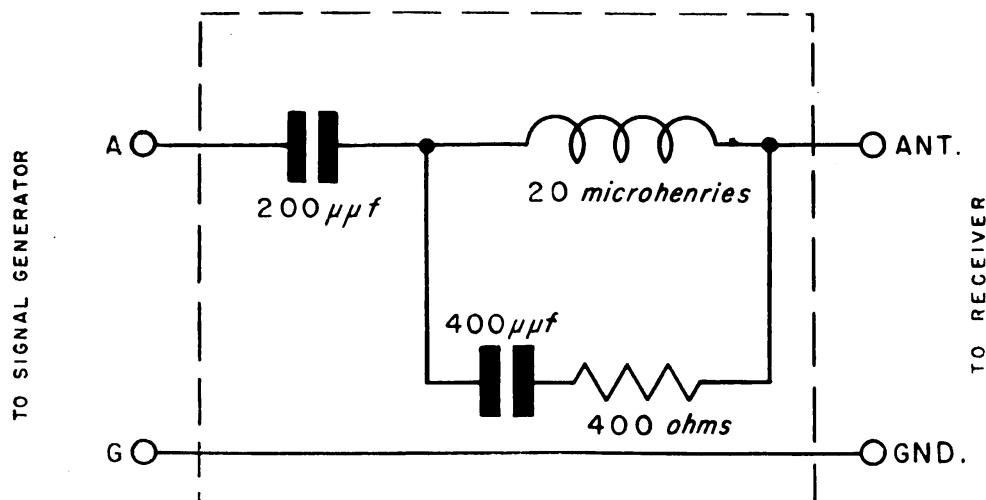

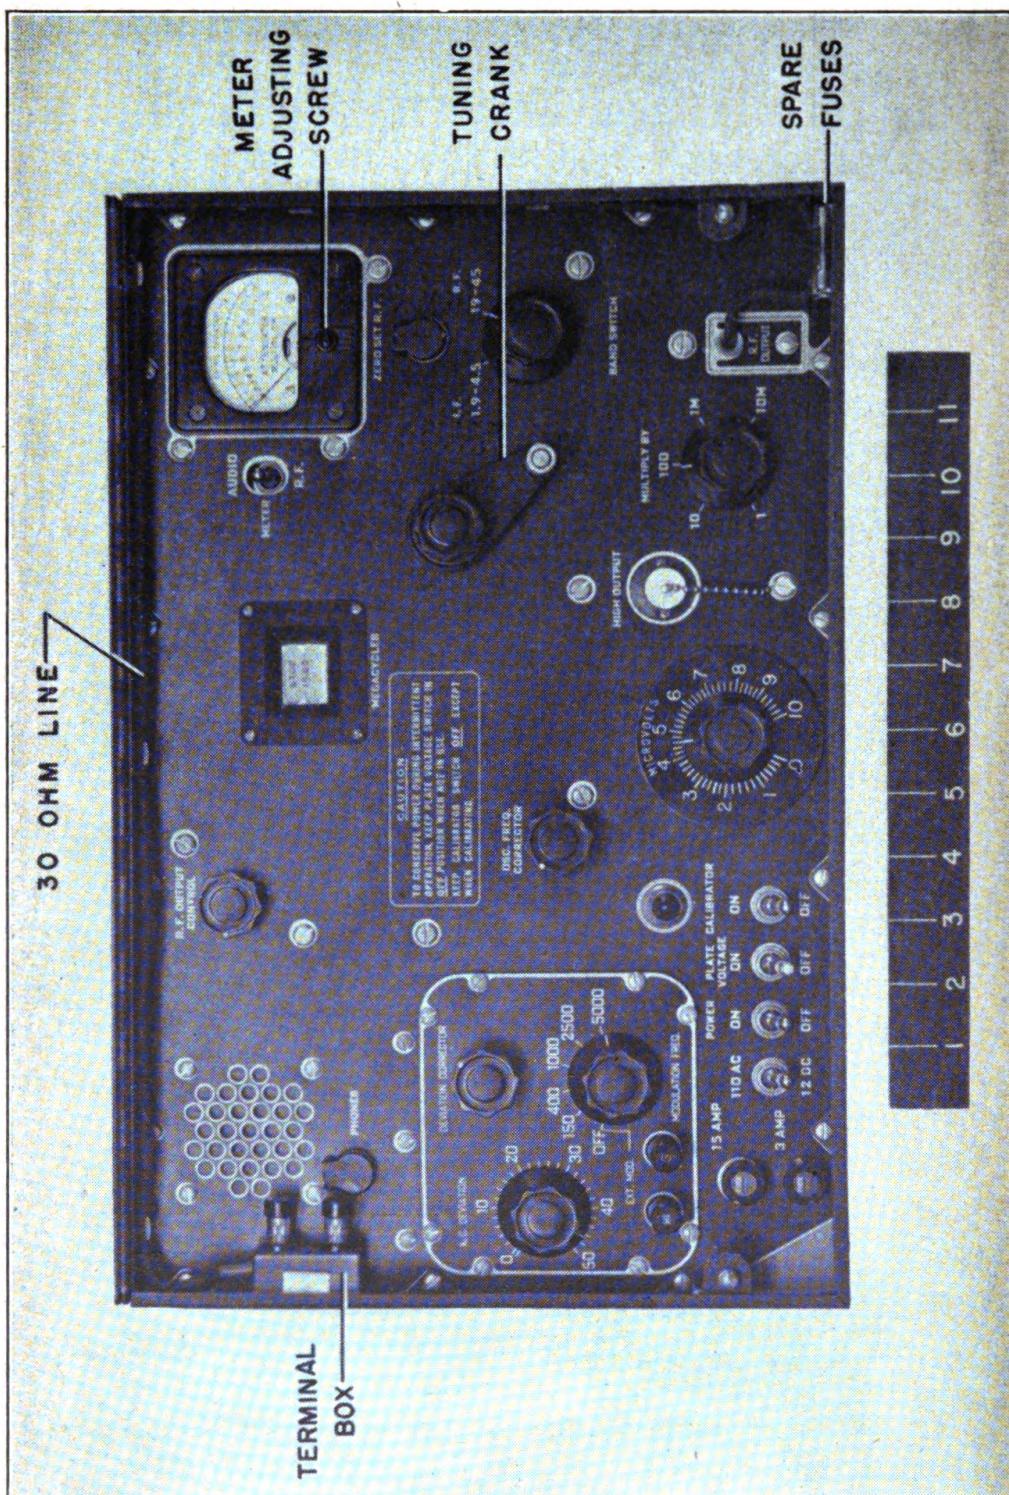

Figure 3—RMA Standard Phantom Antenna

(5) Remove the 30-ohm line from the clips around the edge of the front panel of the signal generator (figure 4).

(6) Make connections between the terminals of the 30-ohm line and the radio receiver according to the instructions in the alignment procedure for the radio receiver. Terminal G is ground. In some installations, if leakage is encountered, it may be necessary to connect the ground binding post of the receiver and the output terminal box of the signal generator directly to the receiver chassis with the shortest possible length of copper braid. The best grounding condition must

**TM 11-317**  
**SIGNAL CORPS**

**Figure 4—Signal Generator I-208, front view**

be determined for the particular installation by trying various means of grounding until the leakage is eliminated.

**b. Voltmeter adjustment (r-f)**

When the operations outlined in sub-paragraphs 6a (1), (2), and (3) are completed:

(1) Turn the R.F. OUTPUT CONTROL to the left as far as it will go.

(2) Throw the METER switch to R.F.

(3) The meter must now read 0. If it does not read 0, lift the spring cover over the ZERO SET R.F. control (figure 4) and adjust the screw under the cover with a small screwdriver until the reading is zero.

(4) Turn the R.F. OUTPUT CONTROL to the right until the meter pointer is set to the red line (1.0) on the scale. The pointer will move as the signal generator is tuned over the frequency range. Always set it back to the red line on the meter scale by adjusting the R.F. OUTPUT CONTROL when the desired frequency has been reached.

**c. Frequency checking**

When the operations outlined in sub-paragraphs 6a (1), (2), and (3) are completed:

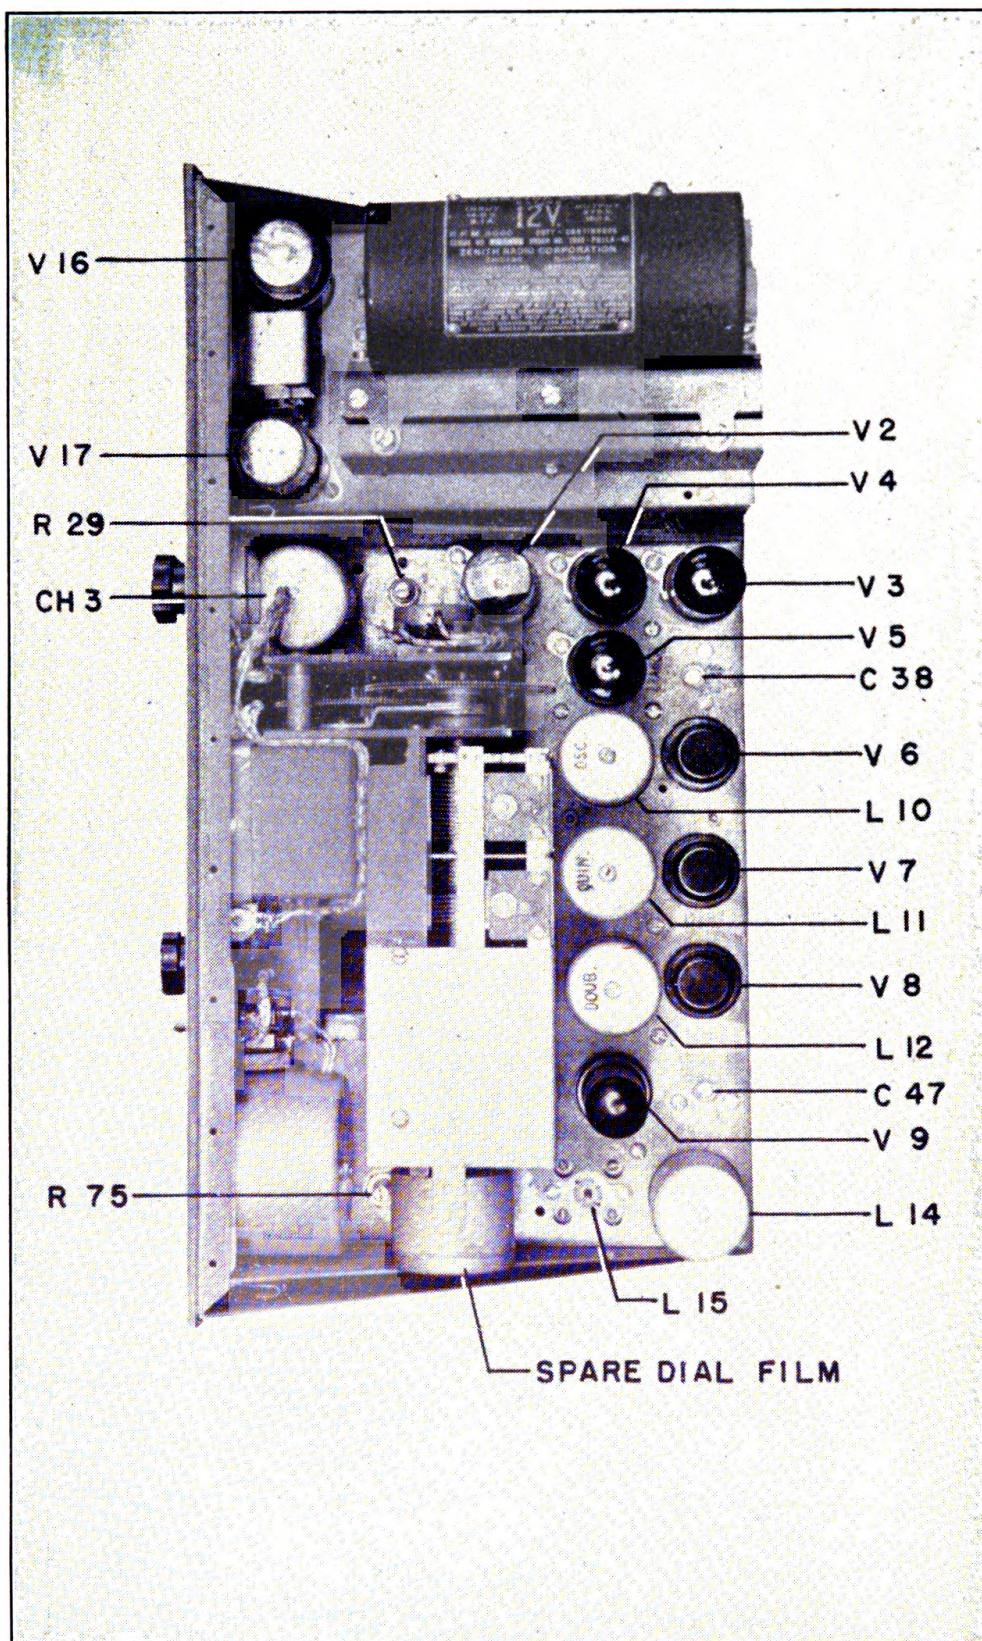

(1) Set the BAND SWITCH to R.F. 19-45 MC. Always calibrate the dial on the 19-45 MC band.

(2) Turn the dial crank until the frequency you want is indicated on the dial film. If the desired frequency is between 1.9 and 4.5 megacycles, multiply the frequency by 10 to determine the dial setting at which the calibration is made. NOTE: While turning the tuning crank a beat note (whistle) is heard in the loudspeaker for each  $\frac{1}{2}$  megacycle as indicated on the dial film. The beat notes may be heard through headsets inserted into the PHONES jack. Inserting a headset automatically disconnects the speaker.

(3) Turn the vernier control knob of the signal generator so that the dial indicates the multiple of .5 megacycles nearest the frequency you want. For example, if the desired frequency is 31.30 megacycles, tune the signal generator to 31.50 megacycles.

**TM 11-317**

**SIGNAL CORPS**

**Figure 5—Signal Generator I-208, top view showing tube locations**

(4) Adjust the OSC. FREQ. CORRECTOR control for zero beat in the speaker or phones. This is the point between the two lowest frequencies which can be heard. As the OSC. FREQ. CONTROL is turned in either direction from the zero beat position, a tone of increasing frequency is heard.

(5) Turn the dial crank to the desired frequency as indicated on the tuning dial.

(6) Throw the CALIBRATOR switch to OFF. When the calibrator is in use, the audio oscillator is automatically disconnected. As a result, a clean beat note is obtained. Keep the CALIBRATOR switch at OFF except when checking the dial calibration of the signal generator. UNLESS THE CALIBRATOR SWITCH IS AT OFF, IT WILL NOT BE POSSIBLE TO MODULATE THE SIGNAL GENERATOR.

(7) If the desired operating frequency is between 1.9 and 4.5 megacycles, set the BAND SWITCH to I.F. 1.9-4.5 MC.

**d. Attenuator adjustment (100,000 microvolts maximum)**

(1) Adjust the R.F. OUTPUT control so that the meter indicates 1.0. If the meter pointer cannot be set to 1.0, set the pointer to a lower scale division and multiply the attenuator settings by the factor indicated on the meter.

(2) Set the MICROVOLTS control and the MULTIPLY BY switch for the desired output voltage. The output voltage in microvolts is the numerical product of the meter indication, the MICROVOLTS dial reading and the MULTIPLY BY switch reading. For example, if you want an output of 5000 microvolts, set the meter pointer to 1.0, set the MICROVOLTS dial to 5.0 and the MULTIPLY BY switch to 1000. If the meter pointer cannot be set to 1.0, set it to .5, set the MICROVOLTS dial to 10, and the MULTIPLY BY switch to 1000. The output voltage is across the terminals at the end of the 30-ohm line.

**e. Attenuator adjustment (output greater than 100,000 microvolts)**

For an output greater than 100,000 microvolts:

(1) Remove the high output cable (Cord CD-749) from the compartment at the rear of the signal generator (figure 2).

(2) Unscrew the knurled cap from the HIGH OUTPUT terminal.

(3) Connect the cord and tighten the knurled fitting of the 100-ohm line to the HIGH OUTPUT terminal.

(4) Connect the other end of the 100-ohm line to the radio receiver to be checked, using the phantom antenna recommended in the alignment procedure of the radio receiver. See paragraph 6a(6).

(5) Adjust the R.F. OUTPUT CONTROL for the output voltage wanted. The output voltage is approximately .7 volt when the meter pointer is at 1.0. For example, if an output of 350,000 microvolts is wanted, set the meter pointer to .5 by means of the R.F. OUTPUT CONTROL. THE MICROVOLTS CONTROL AND THE MULTIPLY BY SWITCH MUST NOT BE USED WITH THE HIGH OUTPUT CABLE.

#### f. Internal modulation

To modulate the output voltage of the signal generator:

(1) Set the MODULATION FREQ. selector switch to the desired audio frequency: 150, 400, 1000, 2500, or 5000. Be sure the calibrator ON-OFF switch is at OFF.

(2) Set the K.C. DEVIATION control to 50.

(3) Throw the METER switch to AUDIO.

(4) Turn the BAND SWITCH to R.F. 19-45 MC.

(5) Adjust the DEVIATION CORRECTOR control so that the meter needle is at the red line on the meter scale. DON'T DISTURB THIS ADJUSTMENT WHILE USING THIS MODULATION FREQUENCY.

(6) Adjust the K.C. DEVIATION control for the desired frequency deviation. The scale is direct reading for the 19 to 45 megacycle range. Divide the scale reading by 10 to obtain the frequency deviation for the 1.9 to 4.5 megacycle range.

(7) Throw the METER switch to R.F. NOTE: THE PROCEDURE OUTLINED IN PARAGRAPH 6f(1) THROUGH (7) MUST BE FOLLOWED FOR EACH MODULATION FREQUENCY USED.

**g. External modulation**

To modulate the output voltage of the signal generator with an external audio source:

- (1) Set the MODULATION FREQ. selector switch to EXT. MOD. (OFF).
- (2) Adjust the audio source voltage to approximately 5 volts rms.
- (3) Connect the external audio source to the EXT. MOD. terminals. The G terminal is ground.
- (4) Proceed as outlined in paragraph 6f(2) through (7).

**h. Final instructions**

- (1) *If the signal generator is to be used intermittently, throw PLATE VOLTAGE switch to OFF when the signal generator is not in use.* This will conserve power and keep the signal generator warmed up for instant use.
- (2) To turn the signal generator off completely, throw the POWER switch to OFF.

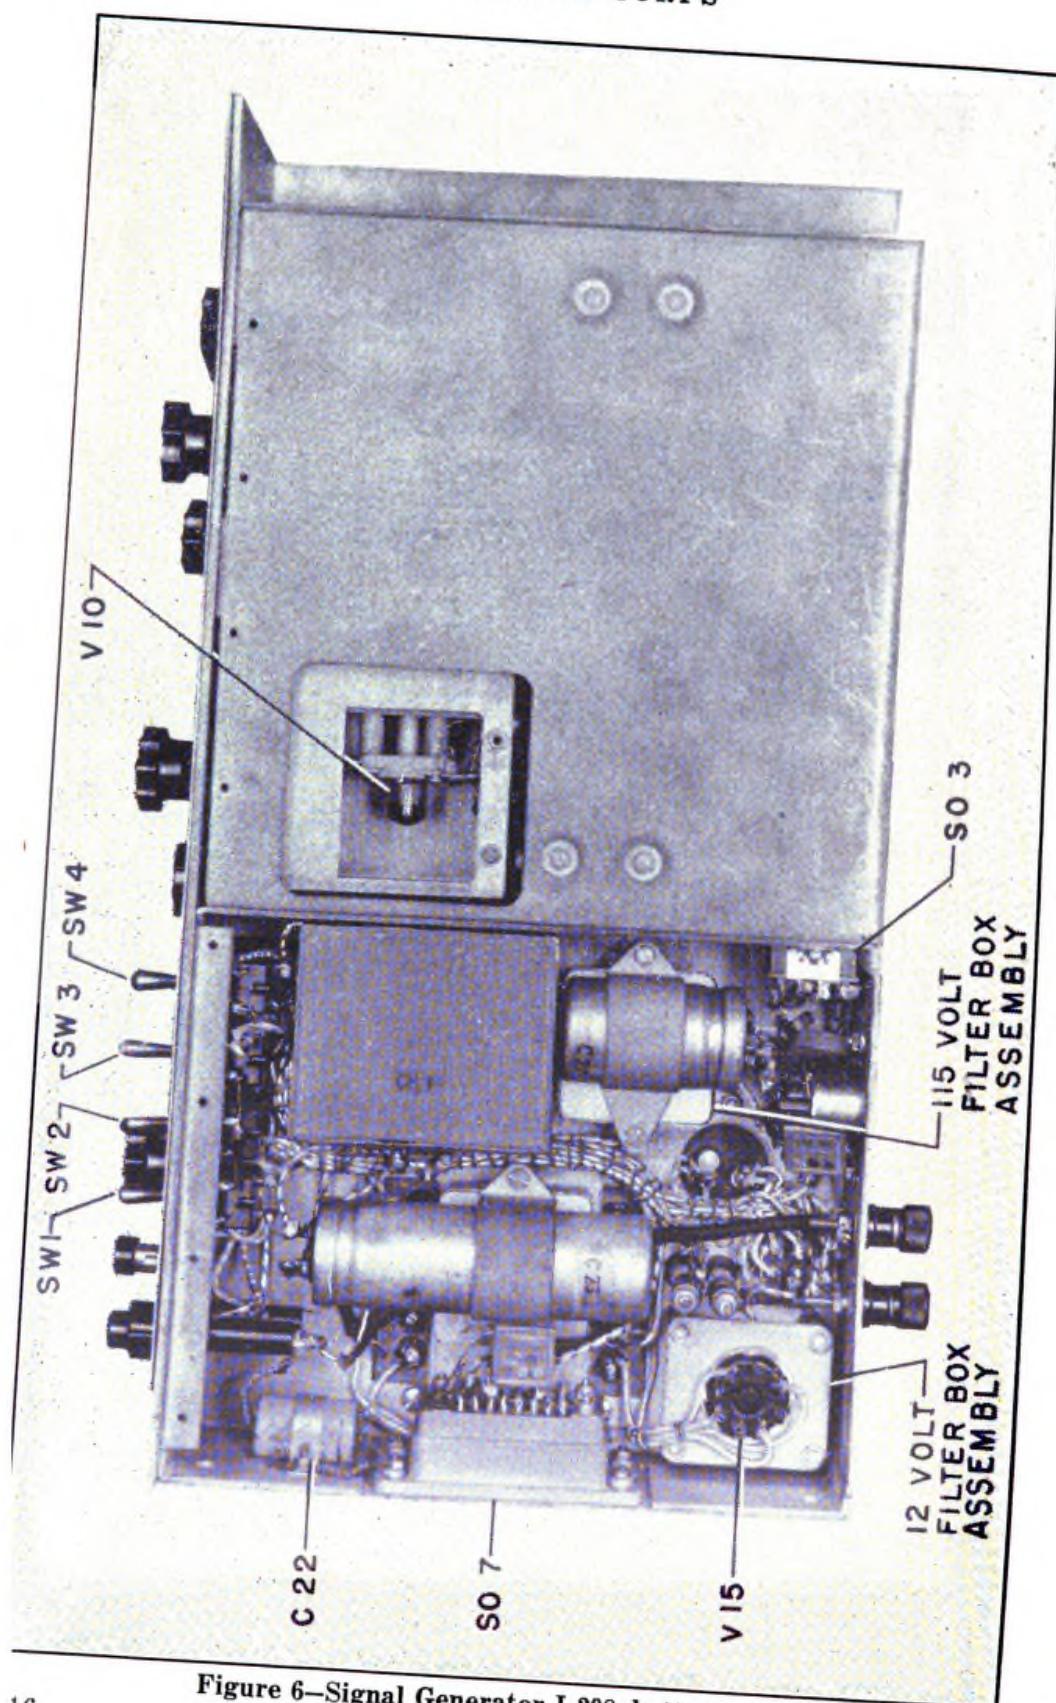

Figure 6—Signal Generator I-208, bottom view

## SECTION III

### DETAILED FUNCTIONING OF PARTS

	<i>Paragraph</i>
Audio oscillator unit .....	7
Radio-frequency unit .....	8
Calibrator unit .....	9
Main power supply .....	10
Dynamotor assembly .....	11

#### **7. Audio oscillator unit**

**a.** The audio oscillator unit is on the left side of the front panel of the signal generator (figure 4). It contains the MODULATION FREQ. selector switch, the K.C. DEVIATION control, the DEVIATION CORRECTOR control, and the EXT. MOD. (external modulation) terminals.

**b.** The audio oscillator unit employs tube V<sub>1</sub> (commercial type 12SN7-GT) (figure 9). One triode section is used in a Hartley oscillator circuit. The frequency is determined by the amount of inductance selected from tapped choke CH-2 and by the arrangement of capacitors C-13, C-14, C-15, and C-16.

**c.** The oscillator output voltages are maintained nearly constant for all frequencies by switch SW<sub>5</sub> which connects resistors R<sub>16</sub>, R<sub>17</sub>, R<sub>18</sub>, R<sub>19</sub>, and R<sub>20</sub> into the oscillator plate voltage supply circuit. Capacitor C<sub>17</sub> by-passes the audio voltage from the oscillator plate to ground. Grid bias for the oscillator is provided by the voltage drop across resistor R<sub>30</sub> in the oscillator cathode circuit. The audio output voltage is impressed across resistor R<sub>21</sub> and potentiometer R<sub>23</sub>, the manual deviation control. The frequency deviation is controlled by setting potentiometer R<sub>23</sub> to the desired deviation as indicated on the K.C. DEVIATION dial. This regulates the audio voltage impressed upon the grid of the second triode section of tube V<sub>1</sub>. Variations in the audio oscillator output voltages are compensated by adjusting variable resistor R<sub>22</sub>, the DEVIATION CORRECTOR control.

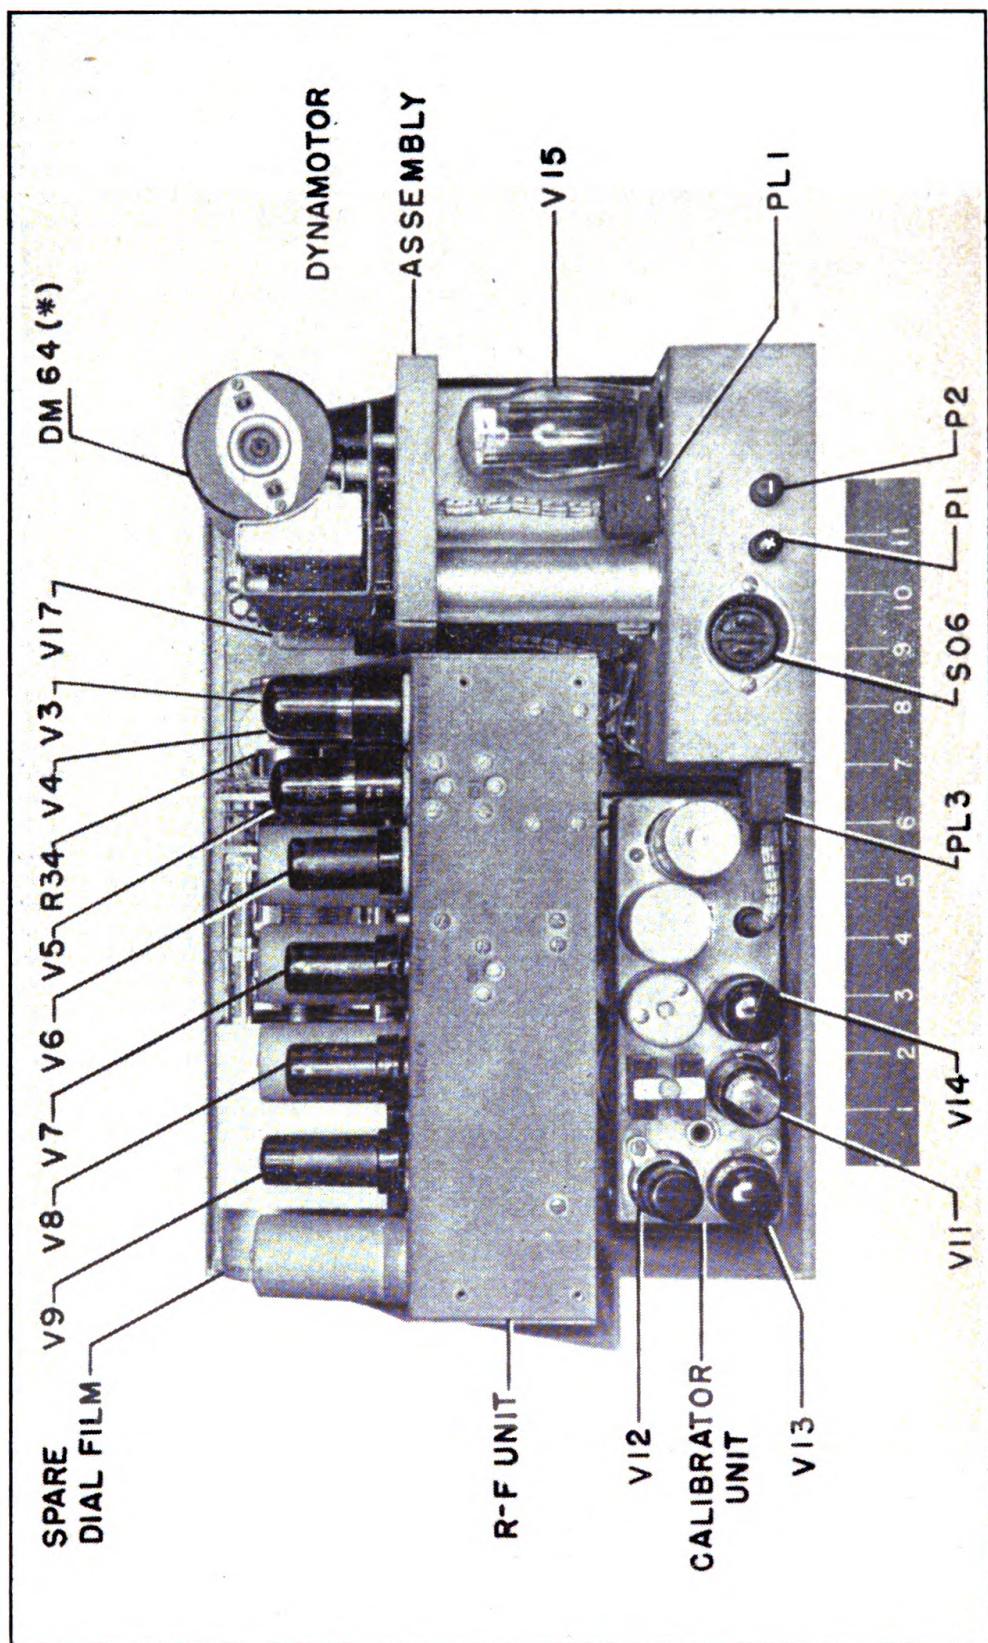

Figure 7—Signal Generator I-208, rear view, dust cover removed

## 8. Radio-frequency unit

a. The r-f unit is located beside the dynamotor assembly and the power supply (figure 7). It contains the frequency modulator, the r-f oscillator, the frequency multipliers, the output stage, the attenuator, and the dial mechanism. The r-f unit is mounted to the front panel. All electrical connections are made through a plug and receptacle to facilitate removal of this unit.

b. The signal from the audio oscillator is impressed across a series circuit consisting of resistor  $R_{33}$ , potentiometer  $R_{34}$ , and resistor  $R_{35}$ . The voltage across this circuit is measured by a vacuum tube voltmeter and is set to the correct value for modulation by adjusting variable resistor  $R_{22}$  which is located in the audio oscillator. The vacuum tube voltmeter circuit employs tube  $V_2$  (commercial type 6SQ7GT). The voltmeter sensitivity is controlled by variable resistor  $R_{29}$ . Tube  $V_2$  is biased beyond cut-off, and no zero adjusting control is necessary.

c. Potentiometer  $R_{34}$  is connected to the tuning capacitor through a special cam arrangement to maintain a constant frequency deviation over the entire r-f range.

d. The voltage from potentiometer  $R_{34}$  is applied through capacitor  $C_{31}$  to the signal grid of tube  $V_3$  [Tube VT-161-( )] and also to one side of choke  $CH_3$ . The other side of choke  $CH_3$  feeds an out-of-phase voltage to the signal grid of tube  $V_4$  [Tube VT-161-( )].

e. Tubes  $V_3$  and  $V_4$  are used in a push-pull reactance circuit utilizing resistors  $R_{40}$ ,  $R_{41}$ , and  $R_{42}$ , and variable capacitors  $C_{36}$  and  $C_{38}$ . Tubes  $V_3$  and  $V_4$  bias voltage is provided by the voltage drop across cathode resistor  $R_{36}$  which is by-passed to ground by capacitor  $C_{34}$ . The plates of tubes  $V_3$  and  $V_4$  are coupled to the oscillator coil  $L_{10}$  by capacitor  $C_{37}$ . Coil  $L_{10}$  is tuned by the following capacitors :

- (1) Tuning capacitor  $TC_1$
- (2) Capacitor  $C_{51}$  (trimmer capacitor)
- (3) Capacitor  $C_{50}$  (frequency corrector capacitor)
- (4) Capacitor  $C_{52}$  (temperature compensating capacitor)

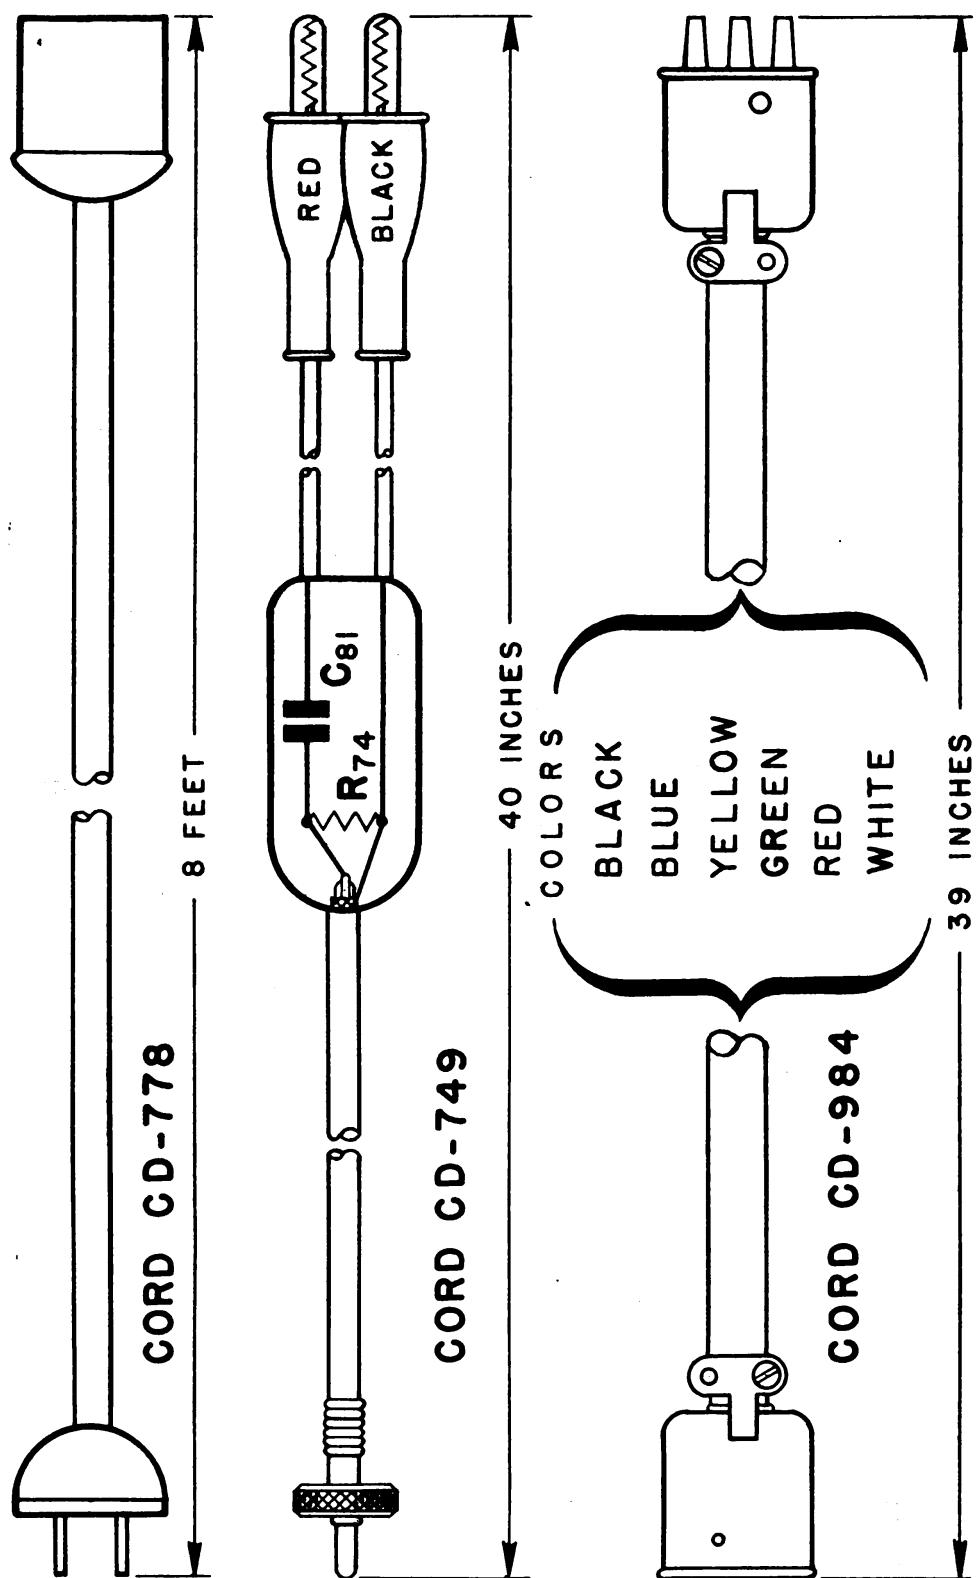

Figure 8—Cords

**f.** The oscillator tunes from 1.9 to 4.5 megacycles. The r-f voltage from the oscillator is applied to the grid of tube  $V_6$  (Tube VT-288), which is employed as a buffer-limiter stage.

**g.** When band switch  $SW_6$  is turned to 1.9-4.5 MC, the r-f voltage from the buffer-limiter (tube  $V_6$ ) stage is fed to the grid of  $V_9$  (Tube VT-247), and the plate of tube  $V_9$  is connected to output coil  $L_{14}$ . This coil is tuned by tuning capacitor  $TC_4$  to the same frequency as that of the oscillator. The secondary winding of coil  $L_{14}$  is connected by means of a 100-ohm line to the variable attenuator. In the 1.9-4.5 MC position, meter  $M_1$  is inoperative when the METER switch is at AUDIO.

**h.** When band switch  $SW_6$  is turned to 19-45 MC, the frequency multiplier stages are connected in the circuit. The output voltage of tube  $V_6$  is fed to the grid of  $V_7$  (Tube VT-288), which is employed as a frequency quintupler stage. Coil  $L_{11}$  and tuning capacitor  $TC_3$  tune its plate circuit to the fifth harmonic of the oscillator frequency. The output voltage of  $V_7$  is fed to the grid of  $V_8$  (Tube VT-288), which is used as a frequency doubler stage. Coil  $L_{12}$  and tuning capacitor  $TC_2$  tune its plate circuit to the second harmonic of the voltage developed in the quintupler stage, which is the tenth harmonic of the oscillator frequency. The output voltage of tube  $V_8$  is fed to the grid of tube  $V_9$  (Tube VT-247). Output coil  $L_{15}$  and tuning capacitor  $TC_4$  tune its plate circuit to the tenth harmonic of the oscillator frequency. The secondary winding of coil  $L_{15}$  is connected to the variable attenuator through the transmission line.

**i.** The attenuator consists of a slide-wire inductance for continuous variation of the output voltage and a fixed voltage divider arrangement used as a step attenuator ( $R_{59}$  through  $R_{67}$ ).

**j.** A vacuum tube voltmeter employing tube  $V_{10}$  (Tube VT-121) is used to indicate the voltage across the attenuator.

**k.** The output voltage is developed across resistor  $R_{68}$ , located in a shielded terminal box at the end of a line having a characteristic impedance of 30 ohms.

1. Cord CD-749, which has a characteristic impedance of 100 ohms, connects to input circuit of the attenuator through the high output terminal (figure 8).
- m. The output voltage of the signal generator is controlled by potentiometer  $R_{37}$  which regulates the screen voltages of tubes  $V_6$ ,  $V_7$ , and  $V_9$ .
- n. The signal generator output frequency is checked by the calibrator unit which is connected to the input circuit of the attenuator through receptacle  $SO_9$  and resistor  $R_{56}$ .

## 9. The calibrator unit

- a. The calibrator unit is located at the rear of the signal generator beneath the r-f unit (figure 7). The calibrator unit contains two Crystal Units DC-23-A (one as a spare) and the components required for frequency checking. The signal generator will operate with the calibrator unit removed, but its frequency must then be checked by some external means.
- b. One triode section of tube  $V_{11}$  is employed in a crystal controlled oscillator circuit. Coil  $L_4$  and capacitor  $C_1$  comprise the oscillator tank circuit. The output of the oscillator is coupled by capacitor  $C_2$  to the crystal frequency doubling stage employing tube  $V_{12}$ . Coil  $L_{16}$  and capacitor  $C_{82}$  comprise the tank circuit, which is tuned to 1000 KC.
- c. The frequency of the crystal oscillator is 500 kilocycles per second.
- d. The output voltages of the frequency doubler and the r-f unit are combined in tube  $V_{13}$  [Tube VT-161-( )] operating as a harmonic generator resulting in an audio beat frequency signal for each multiple of .5 megacycle of the r-f output frequency.
- e. The audio beat frequency voltage is amplified by a triode section of tube  $V_{11}$  and power amplifier tube  $V_{14}$  (Tube VT-134). Transformer  $T_2$  couples the plate of tube  $V_{14}$  to the voice coil of the permanent magnet dynamic loudspeaker  $LS_1$ , located on the front panel.
- f. Capacitor  $C_{12}$  couples the plate of tube  $V_{14}$  to headset jack  $J_1$  also located on the front panel. The loudspeaker voice coil circuit opens when a plug is inserted into jack  $J_1$ .

## 10. Main power supply

- a. The main power supply assembly is shown in figure 7. Its chassis supports all the other units and contains all of the power supply components except the voltage regulator tube, the current regulator tube and the dynamotor. A speaker and headset jack (used in frequency checking) are mounted to the upper left corner of the front panel. A metal guard folds down over the front panel for protection during transit or while in storage (figure 1). A metal dust cover houses the components located behind the front panel and provides storage compartments for cords and connectors (figure 2).
- b. Receptacle SO<sub>7</sub> automatically makes connection to the 12-volt, d-c source of power when the signal generator is installed on Mounting FT-237-(\*). Terminals P<sub>1</sub> and P<sub>2</sub> are wired in parallel with receptacle SO<sub>7</sub> for connecting the signal generator to a d-c power source when not installed on this mounting base.
- c. A line filter consisting of r-f choke L<sub>3</sub> and capacitors C<sub>22</sub> through C<sub>26</sub> prevents r-f signal voltages from entering the line. A similar filter consisting of r-f chokes L<sub>1</sub> and L<sub>2</sub>, and capacitors C<sub>18</sub>, C<sub>19</sub>, C<sub>20</sub>, and C<sub>21</sub> is wired in series with the 115-volt receptacle SO<sub>6</sub>.
- d. Switch SW<sub>2</sub> (POWER) is in series with both the 12-volt and the 115-volt input circuits. When switch SW<sub>2</sub> is closed, the heaters and filaments of all the tubes are turned on.
- e. Switch SW<sub>3</sub> (PLATE VOLTAGE) is in series with both the input circuit of the dynamotor and the center tap of the high voltage winding of power transformer T<sub>1</sub>.
- f. Switch SW<sub>1</sub> (power selector) performs two functions. When this switch is thrown to 12 DC, the heaters of the tubes and the dial lamps are connected to the d-c source of power, and the plate supply filter is connected to the output circuit of the dynamotor. When switch SW<sub>1</sub> is thrown to 115 AC, the heaters of the tubes and the dial lamps are connected to the 12-volt winding of transformer T<sub>1</sub>, and the plate supply filter is connected to the filament of rectifier tube V<sub>15</sub>, Tube VT-244.

**g.** Switch SW<sub>4</sub> (calibrator) at ON grounds terminal No. 2 of CH<sub>2</sub> (audio oscillator choke) stopping the audio oscillator and connects the unregulated plate supply voltage to the calibrator. At OFF switch SW<sub>4</sub> disconnects the unregulated plate supply voltage from the calibrator and connects load resistor R<sub>78</sub> to the unregulated plate supply and disconnects terminal No. 2 of CH<sub>2</sub> from ground.

**h.** The plate supply filter consists of capacitors C<sub>28</sub> and C<sub>29</sub>, and filter choke CH<sub>1</sub>. Resistor R<sub>24</sub> reduces the plate supply voltage to a safe value for the voltage regulator tube V<sub>16</sub> (Tube VT-139) located on the dynamotor chassis. Capacitor C<sub>27</sub> bypasses the regulated plate supply voltage. Resistor R<sub>25</sub> limits the surge current from capacitor C<sub>27</sub> through tube V<sub>16</sub>.

## **11. Dynamotor assembly**

**a.** The dynamotor assembly is located at the upper left corner of the signal generator (figure 7). It contains the dynamotor, the voltage regulator tube, and the current regulator tube.

**b.** Dynamotor DM-64-A contains a noise filter consisting of r-f chokes and capacitors.

**c.** Tube V<sub>16</sub> (Tube VT-139) commercial type VR150-30, regulates the voltage for the oscillator and modulator tubes.

**d.** Tube V<sub>17</sub>, commercial type 1H-20, limits the current drawn from the power supply when the voltage of the power source rises.

SIGNAL GENERATOR I-208

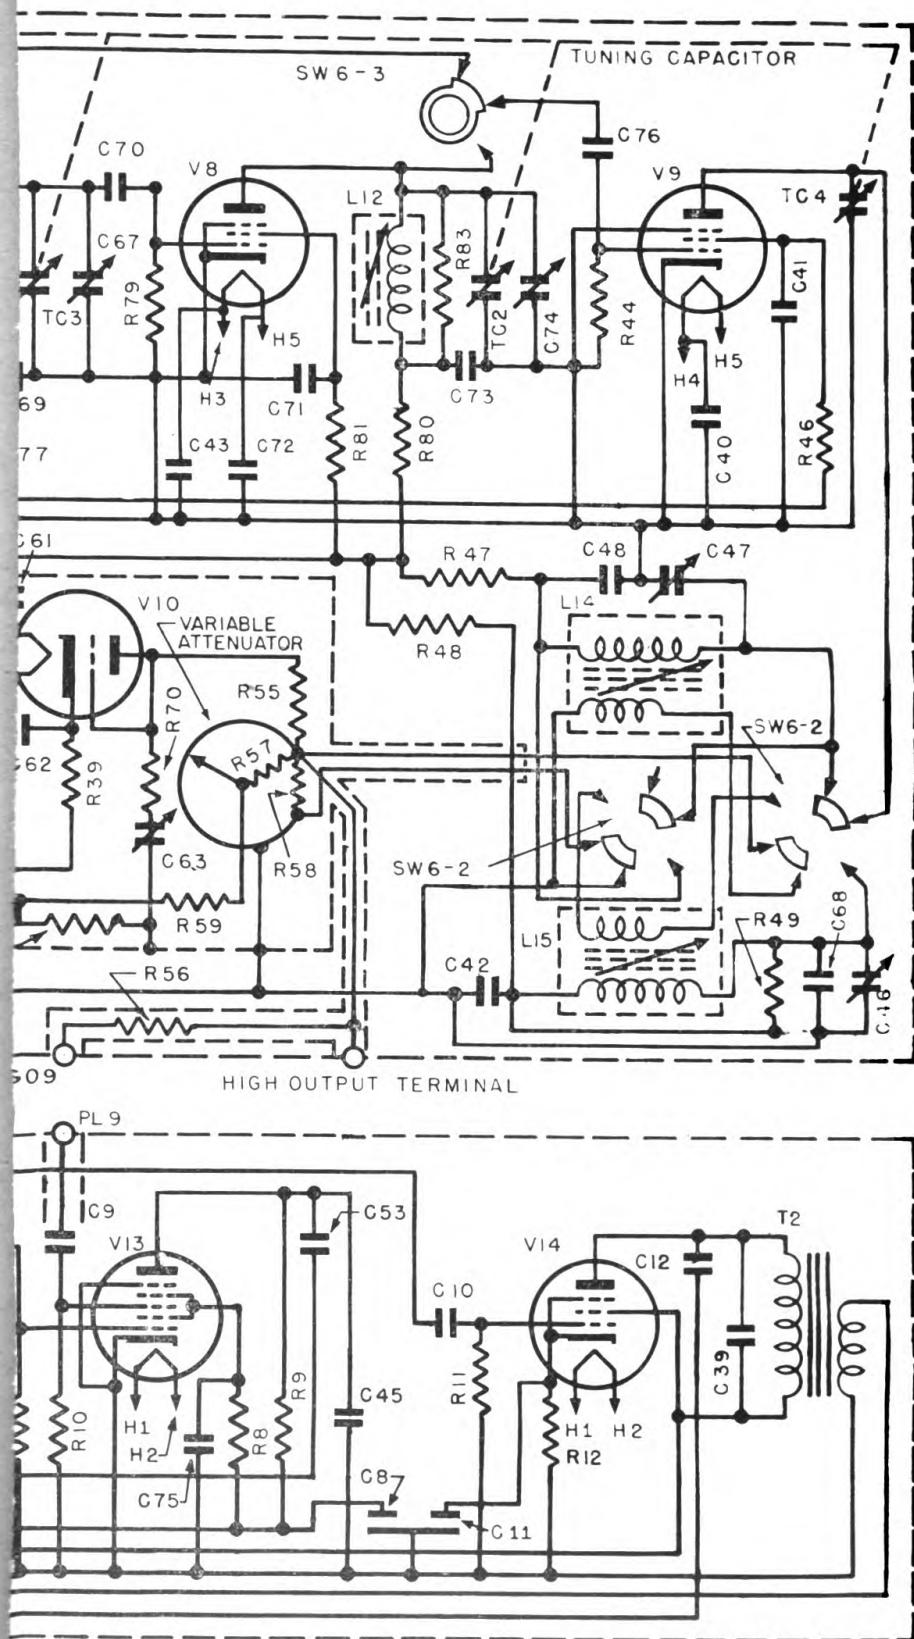

Figure 9—Signal Generator I-208, schematic diagram

## SECTION IV MAINTENANCE

	<i>Paragraph</i>
Procedure in case of equipment failure .....	12
Removal of tubes for testing .....	13
Removal of units .....	14
Adjustments .....	15

### 12. Procedure in case of equipment failure

*Don't make any adjustments before reading this section thoroughly.* Time will be saved in locating the source of trouble if you follow a systematic procedure. Special testing equipment is necessary for some of the adjustments, and if these adjustments are tampered with, the signal generator may be made entirely useless.

Make the following preliminary tests first.

- a. Check cords, connectors, and fuses for open circuits. If the dial lights when the POWER switch is at ON, it is practical to assume that the power connections and fuses are working properly.
- b. If a fuse is burned out, install a new one. Look elsewhere for the trouble if the new fuse burns out.

### 13. Removal of tubes for testing

- a. Remove all the screws from the front edges of the dust cover.
- b. Tilt the signal generator slightly forward and remove the dust cover by pushing it backward.
- c. Remove both the outer and the inner shield from the r-f unit
- d. The r-f VTVM tube  $V_{10}$  can be reached through a removable panel at the bottom of the signal generator (figure 6).
- e. If a tube tester is available, test the tubes one at a time, and as each tube is found to be good, place it in the socket from which it came. For tube locations see figures 5 and 7. Replace tubes which are found to be defective.

**f.** If a tube tester is not available, substitute new tubes of the proper type one at a time. Check the signal generator after each substitution. If installing a new tube does not restore the signal generator to normal operation, replace the old tube before substituting another.

#### 14. Removal of units

##### a. The audio oscillator unit

- (1) Remove the screws from the front edge of the audio oscillator panel.
- (2) Pull the audio oscillator unit forward as far as it will go without disconnecting its power cord. Check socket voltages and resistances in accordance with figures 21, 22, 23 and 24.

##### b. Calibrator unit

- (1) Remove the four screws which hold the calibrator unit to the bottom of the signal generator.
- (2) Disconnect plug PL<sub>3</sub> from receptacle SO<sub>3</sub>.
- (3) Pull the calibrator unit out and to the left, and disconnect PL<sub>9</sub> from receptacle SO<sub>9</sub>.
- (4) Connect plug PL<sub>3</sub> back to receptacle SO<sub>3</sub> and check voltages and resistances in accordance with figure 22.

##### c. Radio-frequency unit

- (1) Remove calibrator unit as outlined in sub-paragraphs 14b(1) through (3).
- (2) Remove all knobs from r-f unit controls.
- (3) Remove cap from HIGH OUTPUT terminal.
- (4) Remove the 30-ohm line from its mounting clips.
- (5) Remove the 11 large binding-head screws which hold the r-f unit to the front panel.
- (6) Remove the r-f unit by pulling it away from the front panel.
- (7) Connect Cord CD-984 to plug PL<sub>2</sub> and receptacle SO<sub>2</sub>.
- (8) Check socket voltages and resistances in accordance with figure 21.

##### d. Dynamotor assembly

- (1) Remove the three large screws located below the speaker on the front panel.

(2) Remove the three flathead screws which hold the dynamotor chassis to the side of the main chassis.

(3) Remove the screw which holds the dynamotor chassis to the supporting rod at the rear of the main chassis.

(4) Disconnect plug PL<sub>1</sub> from receptacle SO<sub>1</sub> and remove dynamotor assembly.

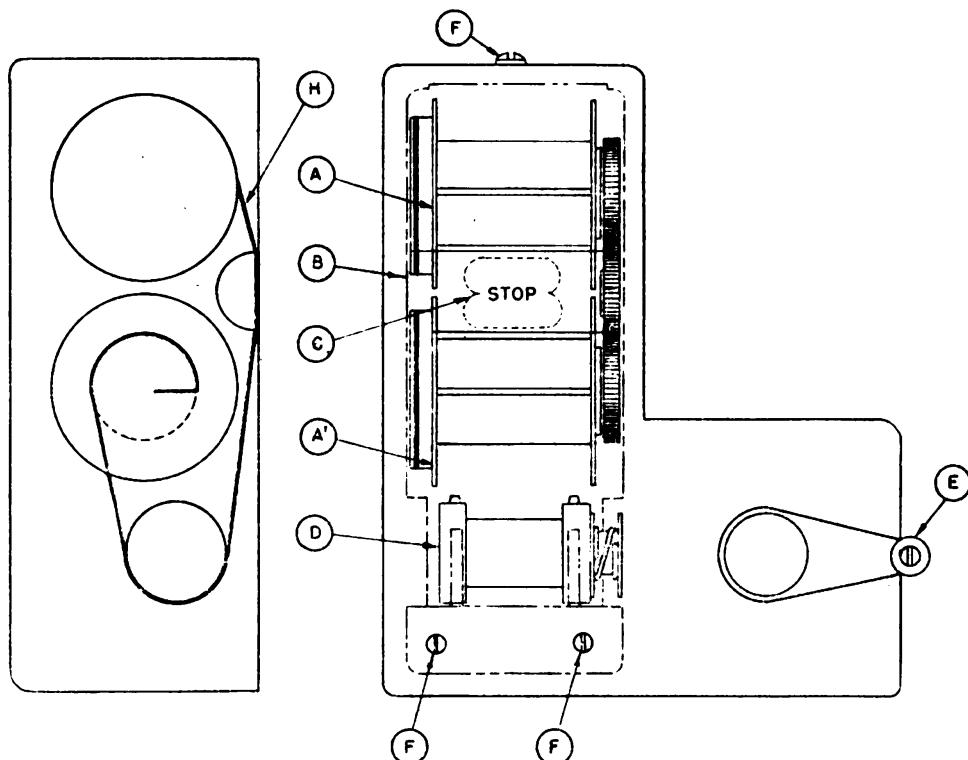

Figure 10—Dial mechanism

#### e. Power supply components

##### (1) Power transformer removal.

(a) Remove dynamotor assembly as outlined in subparagraph 14d.

(b) Remove capacitor C<sub>29</sub>.

(c) Unsolder leads on transformer terminals.

(d) Remove transformer mounting screws.

(2) Removal of POWER, PLATE VOLTAGE, or CALIBRATOR switch.

(a) Unsolder leads at terminals of filter choke CH<sub>1</sub>.

(b) Remove the filter choke by removing the four screws which hold it to the main chassis. Unsolder and remove switch.

f. To replace dial film.

(1) Remove r-f unit as outlined in sub-paragraph 14c.

(2) Remove three screws F (figure 10) and pull out film coverplate.

(3) Remove old film, including any scotch tape used to fasten film to spool.

(4) Turn crank E (figure 10) to the left until the word STOP is reached.

(5) Remove spare film from round can on tuning capacitor shield and check leader length. There should be 10 inches of blank film on each end of the dial as measured from the word START on the high frequency end, and STOP on the low end. If there is more than 10 inches, cut it off.

(6) Make a sharp right angle bend in the low frequency (19mc) end of the film and attach a piece of scotch tape as shown in figure 11.

(7) Insert low frequency end of film in slot in lower spool, fasten with scotch tape, and wind the film on the spool.

(8) Thread the film around the sprocket as shown in figure 10 placing the word STOP at the center of the dial. Make sure the crank E is turned against the stop.

(9) Prepare this end of dial by cutting to 10" from word STOP, bend, and use scotch tape (see figure 11).

(10) Double the film in a large loop and insert it between the sprocket and the end of case to prevent the film from slipping off the sprocket.

(11) Moving the thumbs alternately towards the sprocket, wind the lower spool to tighten the film, then, hold upper spool to prevent lower one from unwinding.

(12) When the lower spool is wound tight, again moving the thumbs in the same direction, wind the upper spool *exactly* 15 turns.

(13) Secure end of film in upper spool as described before. Allow spool to take up surplus film. It is important that the film be held firmly on the sprocket and that the crank is

turned to the left (counter-clockwise) against the stop during the winding of the upper spool. The 15 turns applied to the upper spool gives the *proper* tension to the film and assures

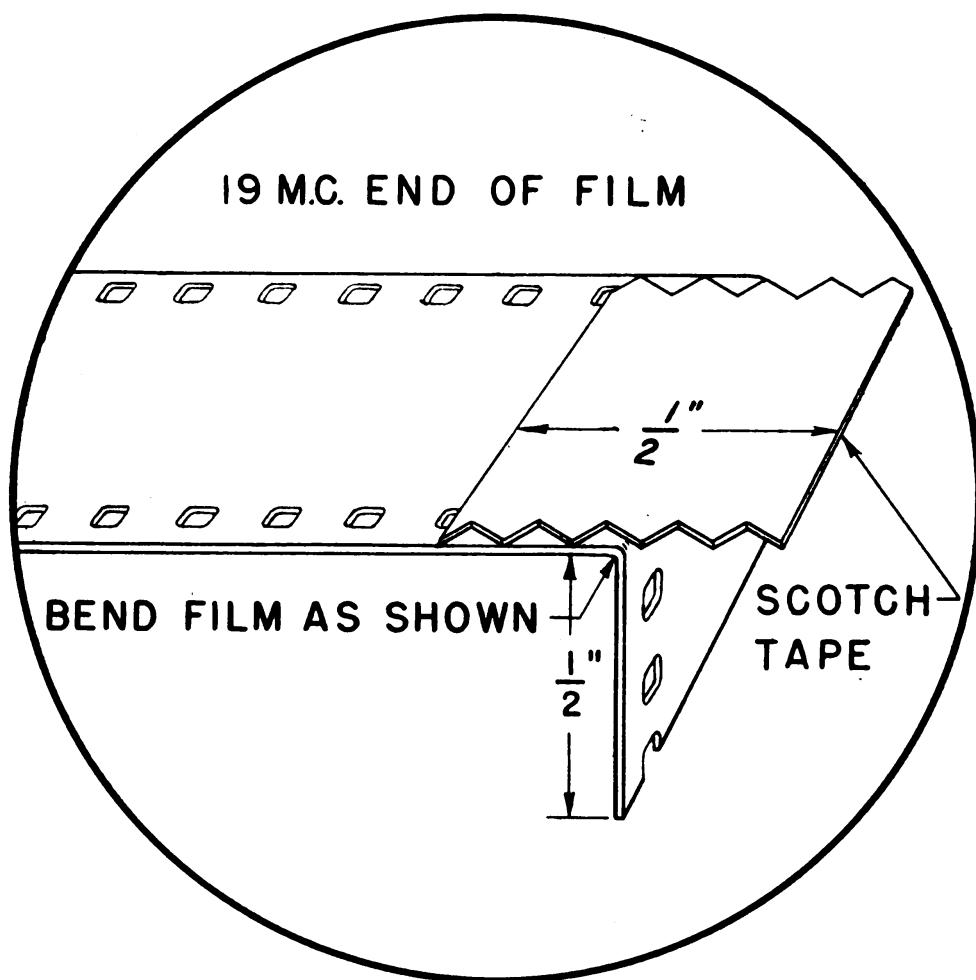

Figure 11—Dial film, preparation for installation

long life. Too much tension wears the film sprocket holes and too little does not permit proper operation.

(14) The film should now be on the spools and sprocket as shown in sketch H (figure 10).

(15) Replace film cover plate and hold in place without screws. Wind film to upper reel, rewind slowly to lower reel, and check STOP point. "STOP" should be in the center of the dial on one end and "START" at the other. Correct if necessary by shifting film on sprocket and fasten cover plate in place with three screws F (figure 10).

(16) Make final check after cover has been replaced. If STOP point is not lined up properly, remove cover plate and advance film on drive sprocket teeth until proper alignment is reached.

**g. Tuning unit**

The tuning unit consists of the dial tuning mechanism, the tuning capacitor, potentiometer R<sub>34</sub>, and the spare dial film. **DO NOT REMOVE THE TUNING CAPACITOR FROM THE DIAL TUNING MECHANISM UNDER ANY CIRCUMSTANCES.** If any part of the tuning unit fails, replace the entire tuning unit as follows:

- (1) Remove r-f unit as outlined in sub-paragraph 14c.
- (2) Remove all wires connected to the tuning capacitor and potentiometer R<sub>34</sub>.
- (3) Remove the five screws which hold the tuning unit to the r-f chassis.
- (4) Remove the four screws which hold the tuning unit to the front panel of the r-f unit.
- (5) Remove the METER switch SW<sub>7</sub> and associated bypass condensers.
- (6) Remove the dial lamp bracket and assembly.
- (7) Lift tuning unit upward and remove from r-f unit.

**h. Replacement of Crystal Unit DC-23-A**

If Crystal Unit DC-23-A is to be replaced with the spare crystal, proceed as follows:

- (1) Loosen the thumb screw and turn crystal hold-down clamp.
- (2) Remove both crystals and insert crystal from SPARE socket into ACTIVE socket.
- (3) Insert a microammeter (0-200 microamperes) equipped with Plug PL-55 into jack J<sub>2</sub> on crystal calibrator unit. The leads connecting the plug to the microammeter should not be over six inches long.
- (4) Turn on the POWER and throw CALIBRATOR switch to ON.
- (5) Adjust capacitor C<sub>1</sub> located on top of coil L<sub>4</sub> shield can for maximum meter reading.
- (6) Tune the signal generator to 40.00 MC on the dial.

The 40.00 megacycle beat frequency of the crystal calibrator should be heard in the phones or speaker. Tune for zero beat.

(7) Adjust capacitor  $C_1$  so that as  $C_1$  is changed it is necessary to tune the signal generator to a slightly higher frequency (toward 40.02 MC) to maintain zero beat. As this adjustment is made the meter will indicate a lower value of grid current. When approximately 70% of the maximum meter reading is obtained,  $C_1$  is properly adjusted.

(8) Remove meter plug from jack  $J_2$ .

(9) Install new spare crystal in SPARE socket and fasten hold-down clamp.

## 15. Adjustments

It is not generally necessary to make the adjustments outlined in this paragraph, as the corrector controls on the front panel will compensate for frequency drift and variations in modulation voltages. However, when a new tube or part has been installed, some further adjustments may be necessary. Try another tube if a new tube seriously alters the frequency or the voltage of the circuit into which it is installed. *It is much better to select a tube which will not change the circuit operation than to install one which will make necessary these adjustments.*

### a. Oscillator frequency adjustment

(1) Throw band-switch to I.F. 1.9-4.5 MC.

(2) Connect output terminals of signal generator to Frequency Meter BC-221-(\*)�.

(3) Set MICROVOLTS dial to 10 and multiplier switch to 10,000.

(4) Set OSC. FREQ. CORRECTOR control so that the white dot on the knob is at the top.

(5) Turn R.F. OUTPUT control to the right.

(6) Turn tuning crank so that dial film indicates 45 MC.

(7) Set the frequency meter to 4500 kilocycles.

(8) Adjust the oscillator trimmer capacitor  $C_{51}$  at rear of r-f chassis for zero beat at the frequency meter.

(9) Turn tuning crank so that the dial film indicates 19 MC.

(10) Set frequency meter to 1900 kilocycles.

(11) Turn the iron core adjusting screw of oscillator coil L<sub>10</sub> for zero beat at the frequency meter.

(12) Repeat adjustments outlined in sub-paragraphs 15a (6) through (11) until you get a zero beat at both 19 and 45 without further adjustments.

**b. Low frequency (1.9-4.5 mc) output coil adjustments**

(1) See that the METER switch is at R.F.

(2) Tune the signal generator to 4.5 MC.

(3) Set the frequency meter to 4500 kilocycles.

(4) Adjust the low frequency output trimmer capacitor C<sub>47</sub> for maximum output as indicated on the meter. If the meter indicator goes off scale, turn the R.F. OUTPUT control to the left until pointer is approximately in the center of the scale.

(5) Tune the signal generator to 1.9 MC.

(6) Set the frequency meter to 1900 kilocycles.

(7) Turn adjusting screw for the iron core of the low frequency output coil L<sub>14</sub> so that the meter indicates maximum output.

(8) Repeat adjustment outlined in sub-paragraphs 15b (2) through (7) until maximum output is obtained at both 19 and 45.

**c. Adjustment of reactance tubes**

If tube V<sub>2</sub>, V<sub>3</sub>, V<sub>4</sub>, or V<sub>5</sub> is replaced, it is necessary to check and readjust the KC deviation. This is accomplished by either of two methods. The first method is outlined in sub-paragraph 15 d(1) through (21) and the second method is outlined in sub-paragraph 15 e(1) through (18).

Always check the KC deviation before making any adjustments since *it will not always be necessary to make adjustments when tubes are replaced*.

**CAUTION: DO NOT ADJUST REACTANCE TRIMMERS C<sub>36</sub> AND C<sub>38</sub>. THESE TRIMMERS ARE ADJUSTED AND SEALED AT THE FACTORY. ANY ADJUSTMENT OF THESE TRIMMERS WILL AFFECT DIAL CALIBRATION ACCURACY.**

**d. Modulation voltage adjustment (panoramic method)**

(1) Refer to figure 12 for the equipment necessary. Two setups are shown.

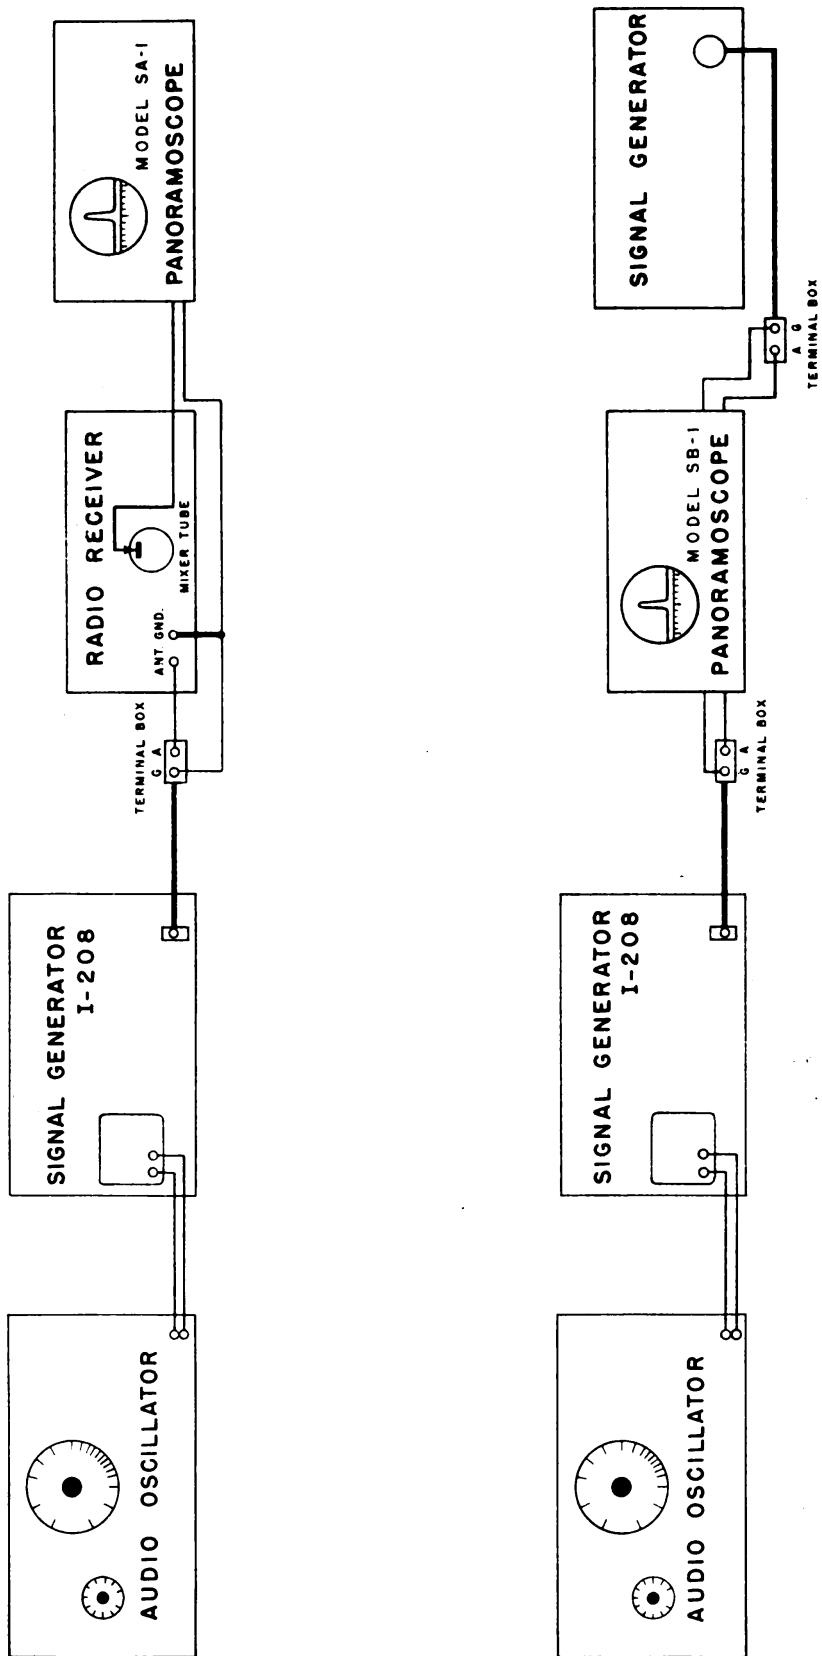

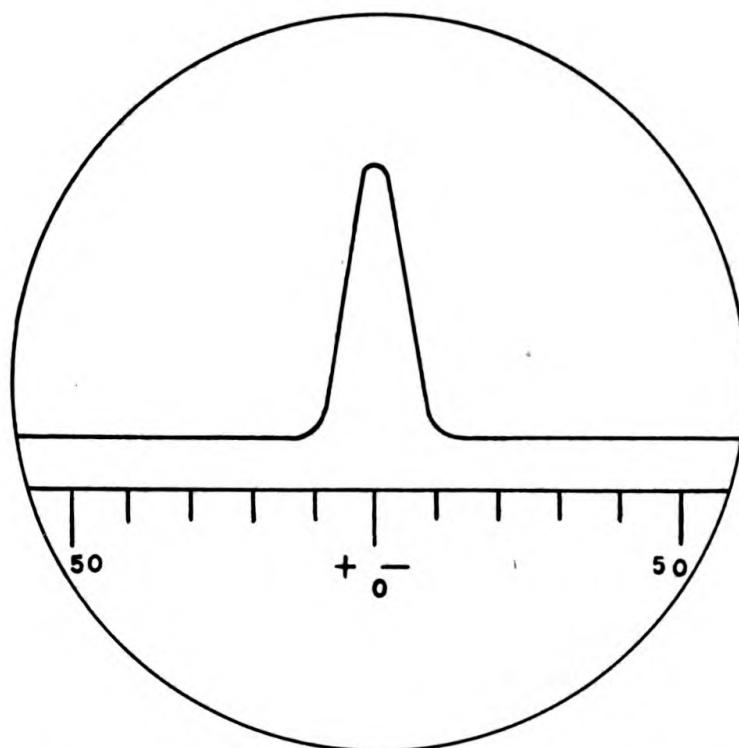

Figure 12—Block diagram showing methods of connecting Signal Generator I-208 to a radio spectroscope

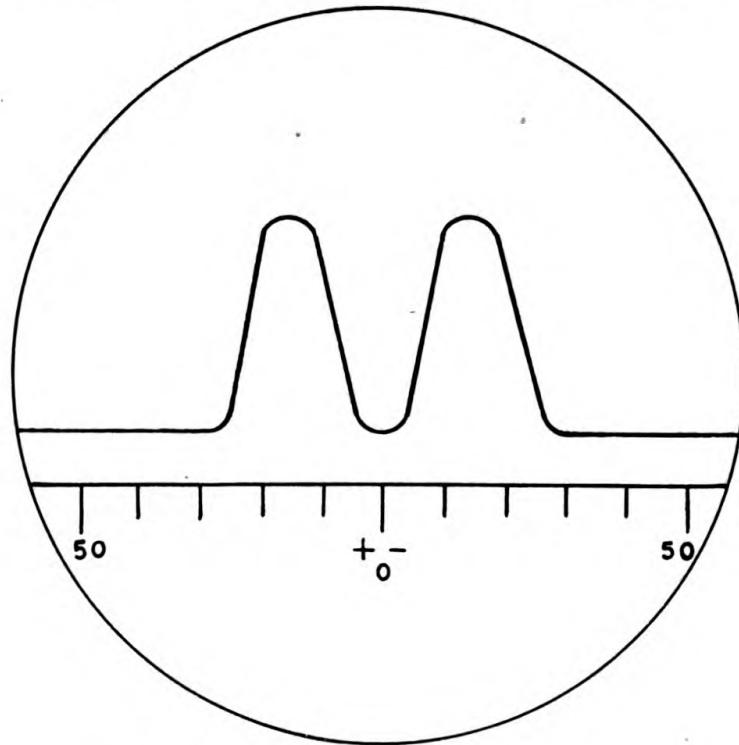

- (2) Connect the signal generator as shown in figure 12.
- (3) Set the MICROVOLTS control to 10.
- (4) Turn the multiplier switch to 10M.
- (5) Adjust the R.F. OUTPUT control so that the meter indicates approximately 1.
- (6) Turn the band switch to R.F. 19-45 MC.
- (7) Turn the signal generator to 19 MC.
- (8) See that the MODULATION FREQ. switch is at EXT. MOD. (OFF).
- (9) Turn the output gain control of the external audio oscillator to zero. Since the accuracy of this adjustment depends upon the frequency accuracy of the audio source, the external audio oscillator should be highly accurate. If such an oscillator is not available, the 5000-cycle modulation frequency of the internal audio oscillator may be used. In this case, however, the error in deviation accuracy introduced will then be a maximum of 5 per cent.
- (10) Throw the METER switch to AUDIO.
- (11) Turn the K.C. DEVIATION control to 43.
- (12) Tune the radio receiver to the frequency of the signal generator. At this point a pattern as shown in figure 13 should appear on the panoramic screen.
- (13) Set the frequency of the external audio oscillator to 5000 cycles per second.
- (14) Turn the gain control of the external audio oscillator slowly to the right until the center frequency peak reaches the horizontal axis. This is a center frequency null point (figure 14). Continue to turn the audio gain control until the third consecutive null point has been reached and leave the control in this position.
- (15) Turn the K.C. DEVIATION control to 50.
- (16) Adjust variable resistor  $R_{29}$  so that the meter indicator is coincident with the red line.
- (17) Turn the tuning dial counterclockwise (left) to 45 MC.
- (18) Audio meter reading at 50 KC should be 1.0. If it is not, adjust DEVIATION CORRECTOR until the audio meter reads 1.0.

**TM 11-317**

**SIGNAL CORPS**

**Figure 13—Panoramic pattern, unmodulated signal**

**Figure 14—Panoramic pattern, first null point**

(19) Turn K.C. DEVIATION control counterclockwise (left) to 0, and then advance the K.C. DEVIATION control until the third null point is obtained. This should occur at 43 KC. If it does not occur, loosen lock nut of  $R_{34}$  (located on the gang condenser) and adjust, by turning the body of the control a small amount at a time, until third null point is obtained at 43 KC. Then lock  $R_{34}$  in place by tightening the lock nut.

(20) Turn dial crank to 19 MC and check third null point. Reset  $R_{29}$ , if necessary.

(21) Check deviation accuracy at line voltages of 107 and 126.5 volts a-c. If a difference of more than 2 or 3 percent exists, adjust  $R_{87}$  until the same reading is obtained at both line voltages.

(22) If it is necessary to replace  $R_{34}$ , proceed as follows:

(a) With a screwdriver, remove the two binding head screws and lockwashers holding the control mounting plate to the tuning unit end plate.

(b) Pull slightly on the control so that the locating pins are disengaged from the end plate.

(c) Holding the control in position by hand, turn the dial tuning crank until the cam drive pin on the tuning condenser drive gear appears in the opening of the tuning unit end plate.

(d) Give the control a slight twist to disengage the cam and cam spring from the drive pin.

(e) With the Bristol set screw wrench mounted on side of tuning unit end plate, remove cam from the control.

(f) Replace cam on new control (be sure to align the set screw on the cam with the flat on the control shaft), and tighten the Bristol set screw with wrench.

(g) Replace Bristol wrench in holder on tuning unit end plate.

(h) Turn cam and control shaft so that it is in approximately the same position as when removed with defective control.

(i) Insert cam through the opening in the tuning unit end plate and adjust until the pin on the tuning condenser drive gear is between the cam and the cam spring.

(j) Holding the control in position by hand, turn the dial tuning crank to 45 megacycles.

(k) Line up the locating pins on the control mounting plate with the holes in the tuning condenser end plate and push in place.

(l) Replace the two binding head screws and lock-washers holding the control mounting plate to the tuning unit end plate and tighten securely.

(m) Adjust modulation voltage as outlined in paragraphs 15e (1) through (20).

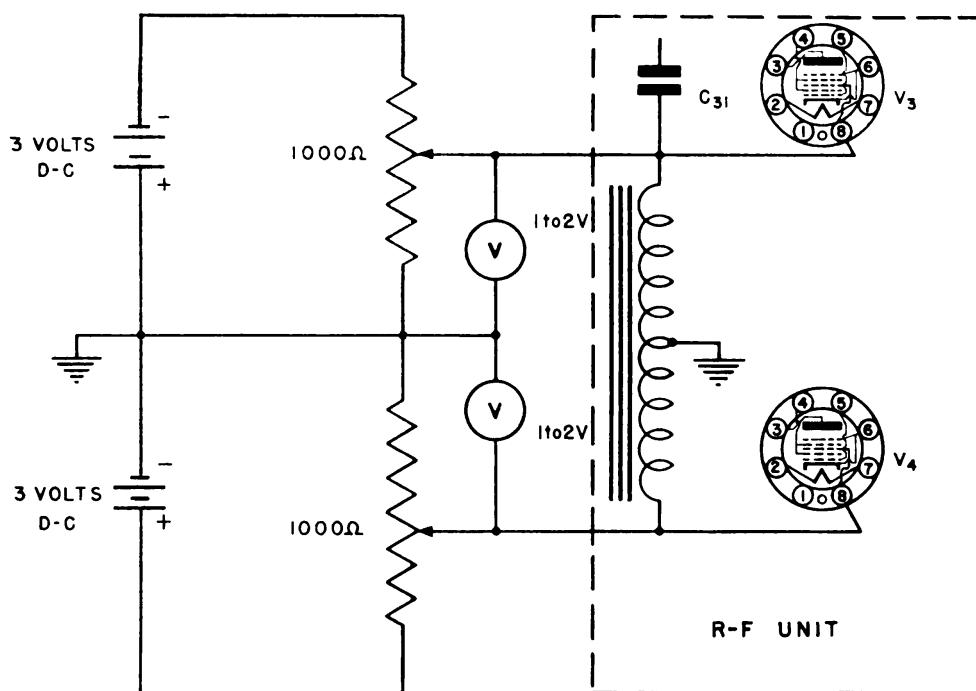

Figure 15—Connection diagram for determination of modulation voltage (d-c method)

#### e. Modulation voltage adjustment (d-c method)

This method of adjustment can be used in an emergency when the panoramic equipment is not available, if tube  $V_2$ ,  $V_3$ , or  $V_4$  is replaced. If any other component part associated with the reactance tubes is replaced, use the method described in sub-paragraph 15d.

(1) Follow procedure outlined in sub-paragraphs 15c(1) through (8).

(2) Connect batteries, potentiometers, and voltmeters to audio input grids of tubes  $V_3$  and  $V_4$  as shown in figure 15.

(3) Set potentiometers so the voltmeters read zero.

- (4) Connect the output terminals of the signal generator to Frequency Meter BC-221-(\*).
- (5) Tune the frequency meter to 1900 kilocycles.
- (6) Turn the band switch to I.F. 1.9-4.5 MC.
- (7) Tune the signal generator to 19.
- (8) Adjust the OSC. FREQ. CORRECTOR control until zero beat is obtained as heard in the headsets of the frequency meter.
- (9) Tune the frequency meter to 1905 kilocycles.
- (10) Increase the voltages on the grids of tubes  $V_3$  and  $V_4$  by adjusting the potentiometers, keeping the voltages equal, until zero beat is obtained.
- (11) Record the voltage indicated on the voltmeters.
- (12) Disconnect the batteries, potentiometers, and voltmeters.
- (13) Connect an a-c vacuum tube voltmeter to the audio input grid of tube  $V_3$ . Make the connection by winding a wire around the No. 8 pin of the tube. Connect the low side of the vacuum tube voltmeter to the chassis.
- (14) Turn the MODULATION FREQ. control to 1000.
- (15) Turn the KC DEVIATION control to 50.
- (16) Turn the band switch to R.F. 19-45 MC.
- (17) Adjust the DEVIATION CORRECTOR control so that the externally connected vacuum tube voltmeter reads .707 of the voltage recorded in sub-paragraph 15d(11).
- (18) Adjust potentiometer  $R_{29}$  so that the indicator of the meter on the signal generator is coincident with the red line.

#### f. Adjustment of the amplifier stages

After having performed the operations outlined in paragraphs 15d or 15e:

- (1) Turn the band switch to R.F. 19-45 MC.
- (2) Turn the R.F. OUTPUT CONTROL to the right.
- (3) Throw the METER switch to R.F.
- (4) Tune the signal generator to 45 MC.
- (5) Adjust capacitors  $C_{67}$ ,  $C_{74}$ , and  $C_{46}$ , for maximum output as indicated on the meter. If the indicator goes off scale turn the R.F. OUTPUT CONTROL to the left so that the meter indicator is approximately in the center.

(6) Tune the signal generator to 19.

(7) Adjust the iron core adjusting screws of coils  $L_{11}$ ,  $L_{12}$ , and  $L_{15}$  for maximum output as indicated on the meter. If the meter indicator goes off scale, turn the R.F. OUTPUT CONTROL so that the meter indicator is approximately in the center.

(8) Repeat operations outlined in sub-paragraphs 15e(4) through (7) until maximum output is obtained at 19 and 45 megacycles without further adjustment.

**g. R-f VTVM sensitivity control adjustment**

This adjustment should be made only if tube  $V_{10}$  is replaced. If this tube is replaced without making the following adjustment, an error of not more than 5 per cent will be introduced.

(1) Connect a vacuum tube voltmeter, capable of measuring radio-frequency voltages as low as 0.1 volt, to binding posts A and G of the R.F. OUTPUT transmission line terminal box.

(2) Set the MICROVOLTS control to 10.

(3) Turn the multiplier switch to 10M.

(4) Turn BAND SWITCH to I.F. 1.9-4.5 MC, and turn dial to 4.5 MC.

(5) Adjust the R.F. OUTPUT control so that the externally connected vacuum tube voltmeter indicates 0.1 volt.

(6) Adjust variable resistor  $R_{75}$  (located on the chassis directly below the spare dial film can) until the meter in the signal generator indicates 1.0.

(7) Turn R.F. OUTPUT control counterclockwise until the stop is reached, and check the zero setting of the meter. If an adjustment of  $R_{73}$ , the zero set control, is necessary, it will also be necessary to readjust  $R_{75}$ .

**h. Adjustment of VTVM frequency compensator**

This adjustment is made at the factory, and readjustment is never necessary unless the setting of  $C_{63}$  is disturbed. If this setting has been changed, first make the adjustments as described in sub-paragraph 15g. Then proceed as follows:

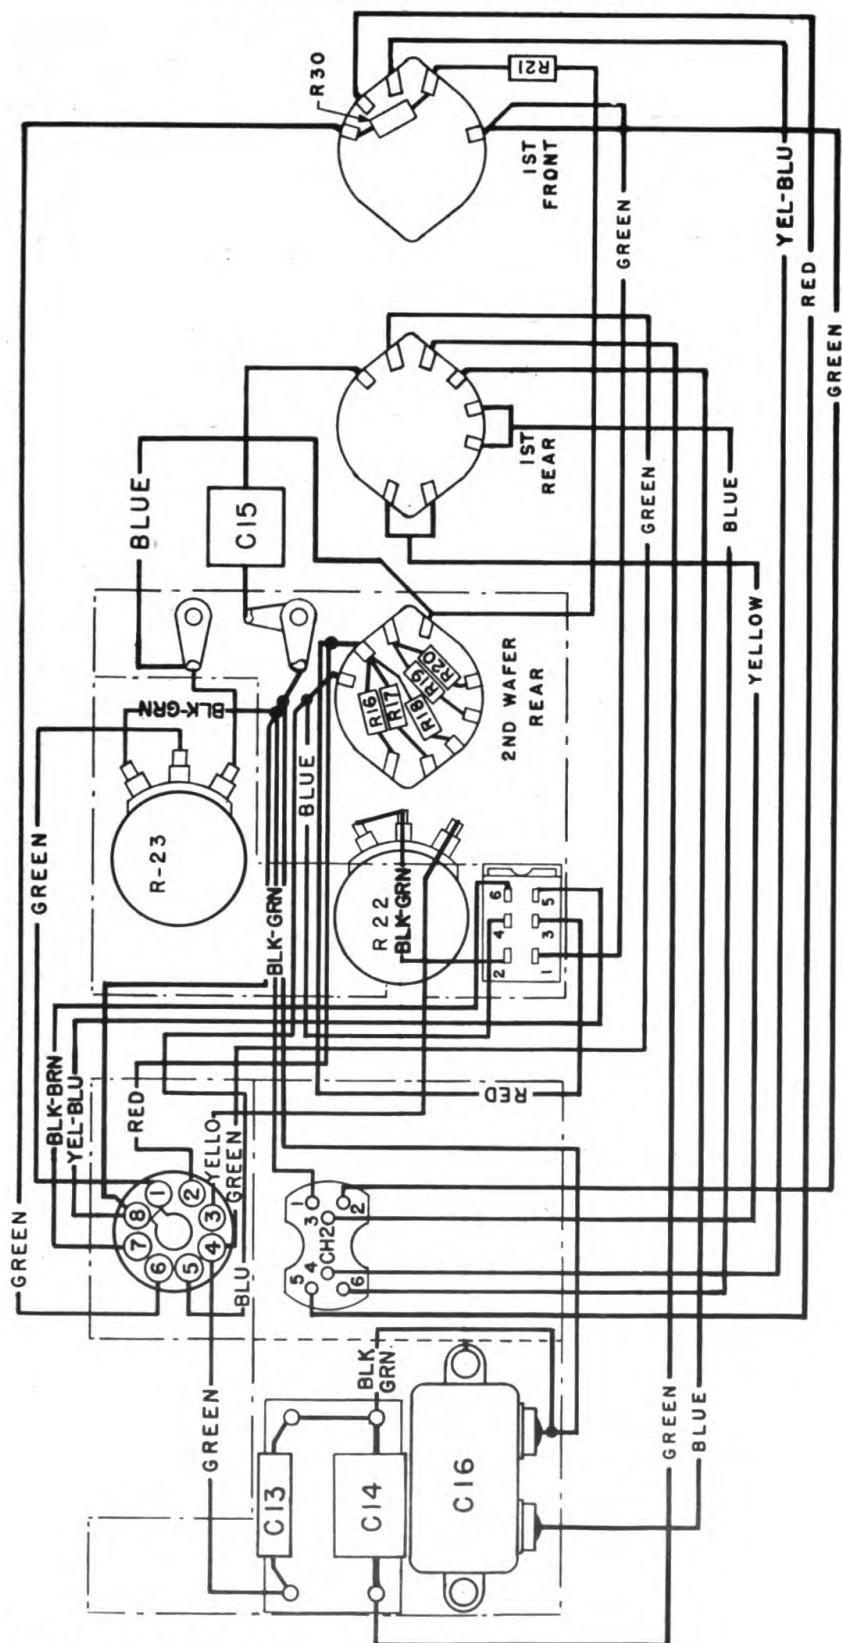

(1) Turn BAND SWITCH to R.F. 19-45 MC.

(2) Turn dial crank counterclockwise (left) to 45 MC.

(3) Advance R.F. OUTPUT control to the right until the external VTVM reads 0.1 volt.

(4) Adjust  $C_{63}$  (located adjacent to tube  $V_{10}$ ) until the meter on the signal generator reads 1.0.

**17. List of Manufacturers**

1. Aerovox Corporation, New Bedford, Massachusetts
2. Allen Bradley Company, Milwaukee, Wisconsin
- International Resistance Company, 401 North Broad Street, Philadelphia, Pennsylvania
- Speer Resistor Corporation, St. Marys, Pennsylvania
- Stackpole Carbon Company, St. Marys, Pennsylvania
3. Alliance Manufacturing Company, Alliance, Ohio
4. American Phenolic Corporation, Chicago, Illinois
5. Amperite Company, 561 Broad Street, New York, New York
6. Arrow-Hart & Hegeman Electric Company, 103 Hawthorne Street, Hartford, Connecticut
7. Bussman Manufacturing Company, St. Louis, Missouri
8. Cannon Electric Development Company, 3209 Humboldt Street, Los Angeles, California
9. Carron Mfg. Co., 415 S. Aberdeen St., Chicago, Illinois
10. Chicago Telephone Supply Company, Elkhart, Indiana
11. Cinaudagraph Speakers, Inc., 3911 South Michigan Avenue, Chicago, Illinois
12. Cinch Manufacturing Corporation, 2335 West Van Buren Street, Chicago, Illinois
13. De Jur-Amsco Corporation, 6 Bridge Street, Shelton, Connecticut
- General Electric Company, West Lynn, Massachusetts
- O. B. McClintock Company, Minneapolis, Minnesota
- Simpson Electric Company, 5208 W. Kinzie Street, Chicago, Illinois
14. Drake Manufacturing Company, 1713 West Hubbard Avenue, Chicago, Ill.
15. Hugh H. Eby, Inc., 18 West Cheltan Avenue, Philadelphia, Pennsylvania
16. Electrical Utilities Company, LaSalle, Illinois
17. Erie Resistor Corporation, Erie, Pennsylvania

18. John E. Fast Company, Crawford & Berry Street, Chicago, Illinois
19. A. P. Foster Company, 719 Wyoming Avenue, Lockland, Ohio
20. General Electric Company, Cleveland, Ohio
21. Gudeman Company, 361 W. Superior Street, Chicago, Illinois
22. Hammarlund Mfg. Company, 424 W. 33rd Street, New York, New York
23. Hedman Manufacturing Company, 1158 Armitage Street, Chicago, Illinois
24. Industrial Condenser, 1725 W. North Street, Chicago, Illinois
25. International Detrola Corporation, 1501 Beard Avenue, Detroit, Michigan
26. Howard B. Jones, 2300 Wabansia Avenue, Chicago, Illinois
27. Kenrad Tube & Lamp Corporation, Owensboro, Kentucky
28. P. R. Mallory & Company, Inc., Indianapolis, Indiana
29. Micamold Radio Corporation, Brooklyn, New York
30. National Company, Inc., 61 Sherman Street, Malden, Massachusetts
31. Oak Manufacturing Company, 1260 Clybourn Avenue, Chicago, Illinois
32. Power Equipment Company, 51 Antoinette Avenue, Detroit, Michigan
33. Raytheon Production Corporation, 420 Lexington Avenue, New York, New York
34. RCA Manufacturing Company, Inc., Camden, New Jersey
35. Solar Manufacturing Company, Bayonne, New Jersey
36. Stackpole Carbon Company, St. Marys, Pennsylvania
37. Underwood Electric Company, 3120 West Grand Avenue, Chicago, Illinois
38. Utah Radio Products Company, 848 Orleans Street, Chicago, Illinois
39. Western Electric Company, Hawthorne Plant, Chicago, Illinois

- Par. 8**
- b.** should read:
  - "The signal from the audio oscillator is impressed across a series circuit consisting of resistor  $R_{33}$ , potentiometer  $R_{34}$ , variable resistor  $R_{89}$ , and resistor  $R_{35}$ . The audio frequency voltage across this circuit is measured by a vacuum tube voltmeter and is set to the correct value for modula-

SUPPLEMENT  
SIGNAL GENERATOR I-208 TM 11-317

Page 19:  
Par. 8  
Cont'd

tion by adjusting variable resistor  $R_{22}$  which is located in the audio oscillator unit. The vacuum tube voltmeter circuit employs tube  $V_2$  (commercial type 6H6) VT-90 double diode as full wave rectifiers. By using this arrangement, the voltmeter loads the circuit equally on each half of the cycle when the METER switch is in R.F. position. The voltmeter sensitivity is controlled by variable resistor  $R_{45}$ . Potentiometer  $R_{87}$  is the zero set adjustment."

c. should read:

"Potentiometer  $R_{34}$  is connected to the tuning capacitor through a special cam arrangement designed to select the correct value of audio voltage necessary to maintain a constant frequency deviation over the entire r-f tuning range. The audio frequency voltage is set by variable resistor  $R_{89}$  to the correct value for 50 KC deviation when the signal generator is tuned to 45 megacycles."

d. should read:

"The audio frequency voltage from potentiometer  $R_{34}$  is applied through capacitor  $C_{31}$  and R.F. choke  $L_9$  to the signal grid of tube  $V_4$  (commercial type 6SG7) VT-211."

e. should read:

"Tube  $V_4$  functions as a reactance tube in parallel with the r-f oscillator tank. The signal grid is fed r-f voltage  $90^\circ$  out of phase with the oscillator tank voltage by the RC network of  $R_{40}$  and  $C_{32}$ . Bias voltage for tube  $V_4$  is provided by the voltage drop across cathode resistor  $R_{36}$ , which is by-passed to ground by capacitor  $C_{34}$ . The plate of tube  $V_4$  is directly connected to

**Page 19:** the oscillator tank and plate voltage is applied through the tank coil  $L_{10}$ . Coil  $L_{10}$  is tuned by the following capacitors:  
**Par. 8**  
**Cont'd**

- (1) Tuning Capacitor  $TC_1$
- (2) Capacitor  $C_{51}$  (trimmer capacitor)
- (3) Capacitor  $C_{50}$  (frequency corrector capacitor)
- (4) Capacitor  $C_{52}$  (temperature compensating capacitor)
- (5) Capacitor  $C_{83}$  (fixed, silver mica capacitor)"

**Page 24:** g. should read:

**Par. 10**

"Switch  $SW_4$  (calibrator) at ON grounds terminal No. 2 of  $SO_4$  and terminal No. 1 of  $SO_2$  thereby removing the modulation voltage from the RF unit and connects the unregulated plate supply voltage to the calibrator. At OFF switch  $SW_4$  disconnects the unregulated plate voltage from the calibrator and connects load resistor  $R_{78}$  to the unregulated supply and disconnects terminal No. 2 of  $SO_4$  and terminal No. 1 of  $SO_2$  from ground, allowing modulation voltage to be applied to the signal grid of tube  $V_4$ ."

**Page 25:** See Signal Generator I-208A, schematic diagram, Figure 9A.  
**Fig. 9**

**Page 33:**  
**Par. 15**

c. Adjustment of reactance tubes should read:

"c. Adjustment of the frequency deviation.

If tube  $V_2$ ,  $V_4$ , or  $V_5$  is replaced, it is necessary to check the KC Deviation accuracy. This can be accomplished by either of two methods. The preferable method is outlined in sub-paragraph 15 d. (1) through

**SUPPLEMENT**  
**SIGNAL GENERATOR I-208      TM 11-317**

- Page 33:  
Par. 15  
Cont'd      (21). Another method is outlined in subparagraph 15 e. (1) through (8).  
Always check the KC deviation accuracy before making any adjustments since *It Will Not Always be Necessary to Make Adjustments when Tubes are Replaced.*"
- Page 33:  
Par. 15      d. (10) **Modulation Voltage Adjustment (Panoramic Method)** should read:  
"Throw the METER switch to AUDIO and check the meter zero setting. Adjust ZERO SET AUDIO control R<sub>87</sub> if necessary."
- Page 35:  
Par. 15      (16) should read:  
"Adjust variable resistor R<sub>45</sub> so that the meter indicator is coincident with the red line."
- Page 37:  
Par. 15      (19) should read:  
"Turn KC DEVIATION counterclockwise (left) to 0, and then advance the KC DEVIATION control until the third null point is obtained. This should occur at 43 KC. If it does not occur, adjust R<sub>89</sub> (located on mounting bracket behind the ZERO SET AUDIO control).  
(20) Turn dial crank to 19 MC and check third null point. Reset R<sub>45</sub> if necessary.  
(21) Turn dial crank to 45 MC and re-check third null point. Reset R<sub>89</sub> if necessary."
- Page 38:  
Par. 15      (m) should read:  
"Measure the resistance between the arm of the control and the terminal connected to R<sub>89</sub>. This resistance should be approximately 100 ohms. If the measured resistance is not approximately 100 ohms, loosen lock nut of R<sub>34</sub> and adjust by turning the body of the control, then lock R<sub>34</sub> in place by tightening the lock nut.  
(n) Adjust modulation voltage as outlined in paragraphs 15 d. (1) through (20)."

Page 38: See new connection diagram for determination of modulation voltage (d-c method)  
Fig. 15 Figure 15A.

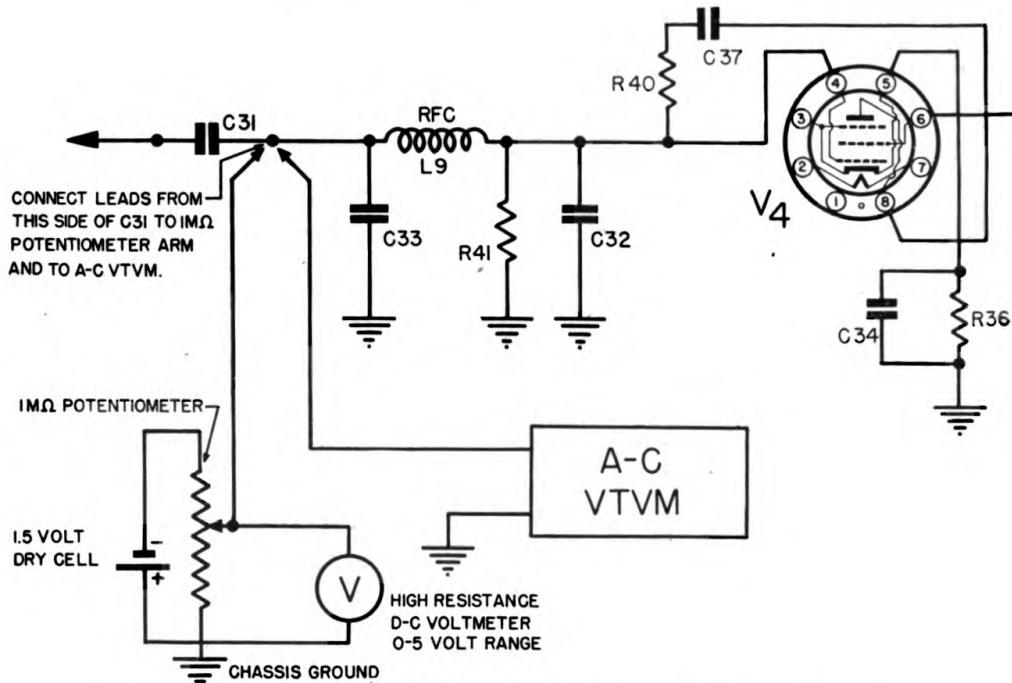

Figure 15A—Revised connection diagram for determination of modulation voltage (D-C method)

Page 38: e. Modulation Voltage Adjustment (d-c Method) should read:

"This method of adjustment can be used in an emergency when the Panoramic equipment is not available and tube V<sub>2</sub> or V<sub>4</sub> is replaced. If any other component part associated with the reactance tube V<sub>4</sub> is replaced, it is preferable to use the method outlined in sub-paragraph 15 d.

- (1) Connect battery, 1000 ohm potentiometer, and voltmeter to grid side of C<sub>31</sub> as shown in Figure 15A.
- (2) Set potentiometer so that the voltmeter reads zero.

**SUPPLEMENT**  
**SIGNAL GENERATOR I-208 TM 11-317**

- Page 38: (3) Connect the output terminals of the  
Par. 15 signal generator to Frequency Meter  
Cont'd BC-221-(\*).
- (4) Set MODULATION FREQUENCY selector switch to OFF.
- (5) Turn on signal generator and allow to "warm up" for 15 minutes.
- (6) Tune the frequency meter to 1900 kilocycles.
- (7) Turn the band switch to IF 1.9-4.5 MC.
- (8) Tune the signal generator to 19.00 on the dial.
- (9) Adjust the OSC. FREQ. CORRECTOR control until zero beat is obtained as heard in the headsets of the frequency meter.
- (10) Tune the frequency meter to 1905 kilocycles.
- (11) Increase the d-c voltage applied to the grid of  $V_4$  by adjusting the 1000 ohm potentiometer across the battery until zero beat is again heard in the headset of the frequency meter.
- (12) Record the d-c voltage indicated on the voltmeter.
- (13) Disconnect the battery, potentiometer, and voltmeter.
- (14) Connect the high side of an a-c vacuum tube voltmeter to the same terminal of  $C_{31}$  as the 1000 ohm potentiometer was connected, indicated in Figure 15A. Connect the low side of the vacuum tube voltmeter to the chassis.
- (15) Turn the band switch to R.F. 19-45 MC.
- (16) Throw METER switch to R.F.

**SUPPLEMENT**

**TM 11-317**

**SIGNAL CORPS**

- Page 38:** (17) Turn R.F. OUTPUT CONTROL to the left as far as it will go and check meter zero setting. Adjust  $R_{73}$  if necessary.
- Par. 15  
Cont'd
- (18) Turn R.F. OUTPUT CONTROL to the right until the meter indicator is set to the red line.
- (19) Throw meter switch to AUDIO.
- (20) Check meter zero setting. Adjust  $R_8$ , if necessary.
- (21) Turn the MODULATION FREQ. selector switch to 1000.
- (22) Turn the KC DEVIATION control to 50 KC.
- (23) Adjust the DEVIATION CORRECTOR control so that the externally connected vacuum tube voltmeter reads .707 of the voltage recorded in sub-paragraph 15 d. (12).
- (24) Adjust potentiometer  $R_{45}$  so that the indicator of the meter on the signal generator is set to the red line.
- (25) Disconnect the external vacuum tube voltmeter."

R <sub>32</sub>	3RC20AE225M	RESISTOR, fixed: carbon; 2.2-meg $\pm 20\%$ ; $\frac{1}{2}$ -w; RC20AE225M (for I-208 only).	1			*	*	*	*
R <sub>4</sub>	3RC20AE106M	RESISTOR, fixed: carbon; 10-meg $\pm 20\%$ ; $\frac{1}{2}$ -w; RC20AE106M.	1			*	*	*	*
R <sub>42</sub>	3Z6001.G7-9	RESISTOR, fixed: wire-wound; 17.5-ohm $\pm 5\%$ ; 5-w; Detrola No. 44401 (for I-208-A only).	1			*	*	*	*
R <sub>28,</sub> 38	3Z6003-35	RESISTOR, fixed: wire-wound; 30-ohm $\pm 10\%$ ; 5-w; Utah No. 5VWQ30.	2			*	*	*	*

**SUPPLEMENT**  
**TM 11-317**

R <sub>24</sub>	3Z6015-30.1	RESISTOR, fixed: wire-wound; 150-ohm ±10%; 10-w; Ohmite Brown Devil.	1
R <sub>78</sub>	3Z6500-139	RESISTOR, fixed: wire-wound; 5,000-ohm ±10%; 10-w; Utah No. CC.	1
R <sub>73</sub>	2Z7278-50	RESISTOR, variable (potentiometer): wire- wound; 200-ohm ±10%; 1-w; 3-term; Detrola No. 44558 part of r-f unit; zero set control.	1
R <sub>34</sub>	2Z7279-62	RESISTOR, variable (potentiometer): wire- wound; 2,000-ohm ±10%; 1-w; 3-term; CTS No. 3215; Detrola No. G44536; (part of r-f unit); frequency deviation regulator.	1
R <sub>69</sub>	2Z7279-98	RESISTOR, variable (potentiometer): wire- wound; 1,000-ohm ±10%; 1-w; 3-term; CTS No. 4264 (for I-208-A only).	1
R <sub>29</sub>	2Z7280-81	RESISTOR, variable (potentiometer): wire- wound; 5,000-ohm; 1-w; 3-term; CTS No. 4265; part of r-f unit, audio VTVM sensi- tivity control (for I-208 only).	1
R <sub>22</sub>	2Z7280-80	RESISTOR, variable (potentiometer): wire- wound; 10,000-ohm ±10%; 1-w; 3-term; CTS No. 3180; Detrola No. 44559; part of audio osc unit; deviation corrector.	1
